FOREWORD

For the U.S. aerospace industry, 1980 was a year of solid growth in virtually all categories of activity.

Sales reached a new record level, which—even allowing for the high rate of inflation—reflected an excellent year overall. In terms of inflation-adjusted constant dollars, sales in 1980 topped those of every year since 1969.

Measured as a percentage of sales, earnings dipped well below the all-time high recorded a year earlier. Still, for the fourth consecutive year, the profit rate was above 4 percent. The general improvement in profit levels is encouraging since future capital needs of the industry will be considerable if it is to fund future generations of commercial aircraft and the expected buildup in the defense sector.

Once again, we are gratified by the industry's achievements in the international marketplace, which underscore the importance to the U.S. economy of high-value, high-technology aerospace exports. The industry recorded its highest-ever levels of export sales and trade balance, thus offsetting to a great extent the lagging U.S. performance in other areas of international trade. The aerospace trade balance, best among U.S. manufacturing industries, is particularly impressive in view of growing foreign competition and a resultant significant increase in aerospace imports.

During 1980, the industry's total backlog increased by more than 20 percent, with gains in all major categories. This assures continuing high activity levels for immediate future years.

The outlook for the longer term is similarly bright. The industry's defense production, which declined as a percentage of the total during the 1970s, seems headed for a new upturn in light of the Administration's projected defense outlays for coming years.

Despite the debut of the Space Shuttle, there is little immediate prospect for expansion of the industry's workload in development and fabrication of civil space systems. However, funding for military space development has been increasing steadily in recent years, to the point where civil and defense space outlays are now almost equal. Moderate growth is expected in the space sector during the first half of this decade. With the expanded capability the Shuttle affords for both civil and defense space operations, space activity could increase significantly in the latter part of the decade.

While deliveries of commercial transports in 1981 are expected to be fewer than in 1980, the large backlog of orders indicates a continuing high level of production in the near-term. The financial problems of the world's airlines have slowed the flow of orders, but the airlines' need for new and replacement aircraft has not changed; projections show a world transport market of about \$125 billion over the next 10 years. Given expected improvement in the airlines' financial status, and consequent resumption of earlier-contemplated re-equipment plans, transport manufacturing activity may go well beyond its current level.

In summary, the year was a good one for aerospace. The strong performance of sales and exports and record backlog, along with excellent prospects for the commercial transport and defense sectors, hold out the promise of continued health and growth for the industry.

Karl G. Harr, Jr.
President
Aerospace Industries Association

AEROSPACE SUMMARY

The aerospace industry closed out the first year of the new decade on a high note, recording new statistical peaks in sales, backlog, exports and contribution to the U.S. trade balance. Much of the statistical growth, of course, was due to the high U.S. inflation rate. However, there was also substantial *real* growth, as gains in many categories exceeded the nine percent inflation rate by wide margins. Sales, for example, increased almost 19 percent, backlog more than 20 percent and exports more than 32 percent.

Here is a breakdown of the in-

dustry's 1980 performance:

Sales. Total sales amounted to \$53.3 billion, an increase of \$8.4 billion over 1979. Most of the increase—more than \$5 billion—was due to a sharp boost in aircraft sales, but there were gains in all categories.

Aerospace industry sales as a percentage of the Gross National Product increased from 1.9 percent in 1979 to two percent in 1980. In relation to total sales of all U.S. manufacturing industries, aerospace sales amounted to three percent; the figure compares with 2.7 percent in the previous year.

Profit. The industry's net profit after taxes, measured as a percentage of sales, was 4.2 percent. This represented a substantial drop from the five percent recorded in the previous year. A major factor in the reduced profit rate was high interest on borrowings necessary to finance new plant and equipment expenditures at a time when such expenditures were at their highest-ever level. As in previous years, the aerospace profit remained well below the average for all U.S. manufacturing corporations, which was 4.9 percent in 1980.

Backlog. Once again—as in the previous year—the industry's backlog climbed dramatically. At year-end 1980, orders on the books amounted to more than \$95 billion, up almost \$17 billion over year-end 1979. The backlog included \$53.6 billion in non-government orders and \$41.5 billion in government work.

Following the traditional pattern, orders for aircraft—including engines and parts—constituted the principal element of the backlog—\$59.5 billion or more than 62 percent. There were also major gains in orders for non-aerospace products produced by manufacturers, and for "other aerospace," a category which includes conversions, modifications, and ground support equipment, as well as basic and applied research, and design and development. A moderate increase was recorded in missile/space backlog.

Civil Aircraft Production. In 1980, shipments of civil aircraft were down almost 5,000 units below the level of

the previous year, but the dollar value of shipments increased substantially, from \$10.6 billion in 1979 to \$13.1 billion in 1980. A marked decline in general aviation aircraft deliveries reduced total civil aircraft shipments to 13,634 units, down from 18,450 in 1979.

As is generally the case, the bulk of the dollar value of 1980 shipments was in commercial transports—\$9.9 billion or more than 75 percent of the total; the amount represents an increase of \$1.9 billion over 1979 sales. The industry delivered 387 transports, 11 more than in 1979. In both dollar value and numbers, gains were far below those of the previous year.

General aviation plane shipments totaled 11,881, the lowest level since 1972; the figure compares with 17,055 in 1979. However, the value of shipments increased by some \$300 million, to \$2.5 billion. The major portion of the production drop was in relatively low-value single-engine aircraft, an area severely impacted by the state of the U.S. economy, fuel costs, and, in particular, high interest rates. But the industry delivered 330 jet aircraft (up 14 percent) and 795 turboprops (up 25 percent). Increases in these higher-value categories more than offset lower single-engine sales.

Civil helicopter production continued the upward trend in evidence since 1976. The industry's rotary-wing segment produced 1,366 civil helicopters, 347 more than in 1979. Dollar value increased from \$403 million in 1979 to \$656 million in 1980.

Military Aircraft Production. The declining trend of earlier years was

reversed in 1980 as military aircraft production increased in number of deliveries and in dollar value. The Department of Defense accepted 606 aircraft for operation by the U.S. military services, compared with 531 in 1979. The Air Force led in acceptances with 359 aircraft, 48 more than in the previous year. Army acceptances totaled 160, up 43 from 1979, and deliveries to the Navy declined from 103 units in 1979 to only 87 in 1980.

The military services also accepted 194 aircraft—nine fewer than in 1979—for delivery to foreign governments under Foreign Military Sales and Military Assistance Programs. Total value of all acceptances—including aircraft for both U.S. and foreign use—was \$5.8 billion, up \$300 million over 1979.

The industry also produced 228 military-type aircraft which were exported commercially on a direct manufacturer-to-foreign government basis. This brought the total military aircraft production for 1980 to 1,028 units, compared with 837 in 1979.

Missile Programs. Overall sales of missile systems, including both production and R&D work, amounted to \$6.7 billion in 1980. This compares with \$5.9 billion in 1979 and represents an increase of 13.6 percent.

Excluding funding for research, development, test and evaluation, sales of missile systems, parts and propulsion units totaled \$4.5 billion, down from \$4.7 billion in 1979. Backlog, more than \$7 billion at the end of 1980, was \$1 billion higher

than at the end of the previous year.

Space Programs. Combined sales of civil and military space vehicle systems, excluding propulsion units, amounted to \$3.3 billion in 1980. The figure is not directly comparable to 1979's \$2.5 billion due to a change in statistical reporting procedures in which the 1980 total includes, for the first time, sales to customers other than U.S. government agencies. In 1980, sales of space vehicle systems accounted for six percent of the industry's total sales. Civil space sales, at \$1.7 billion, continued to lead military sales (\$1.5 billion), but the gap narrowed during the year.

Research and Development. Aerospace industry expenditures for industrial research and development, including both government-sponsored and company-funded effort, declined slightly, from \$8.5 billion in 1979 to \$8.3 billion in 1980. The decline was contrary to a national trend in which R&D outlays for most U.S. industries increased substantially. Aerospace, which led all industries in 1979 expenditures, slipped to second place behind the electrical machinery industry. Estimates for 1981 show that aerospace R&D expenditures will increase by roughly 10 percent to \$9.1 billion.

Federal outlays for R&D, a general indicator of industry activity levels, will increase in Fiscal Year 1981. In areas primarily affecting the aerospace industry, Department of Defense outlays are estimated at \$15.6 billion (up more than 15 percent).

NASA R&D funding for FY 81 is \$5.1 billion (up nine percent) and outlays for the Department of Energy are estimated at \$5 billion (up seven percent). Federal FY 1981 outlays for aeronautical R&D will decline across the board; the total of \$2.8 billion is \$123 million less than in the previous year.

Non-aerospace Sales. AIA estimates of sales of non-aerospace products and services by aerospace manufacturers showed continued growth and a new peak level of \$9.4 billion, up from \$7.7 billion in 1979. The 1980 figure represents 17.6 percent of total industry sales; a decade earlier it constituted 10.6 percent.

Foreign Trade. Once again setting new records for export sales and net trade balance, the aerospace industry made a significant contribution to the national economy by offsetting U.S. deficits in other areas of international trade. At \$15.5 billion, aerospace exports were almost \$4 billion above the previous peak level of \$11.7 billion in 1979; they represented 7.2 percent of all U.S. merchandise exports. With a trade surplus of \$12 billion, aerospace again led all U.S. manufacturing industries in positive contribution to the nation's trade balance.

This trade surplus was achieved despite a sharp increase in aerospace imports that reflected strong and growing competition from foreign manufacturers. Imports totaled \$3.6 billion, more than double the 1979 level. Some of the increase is attributable to changes in tariff schedules and reporting categories, but most of it stemmed from further

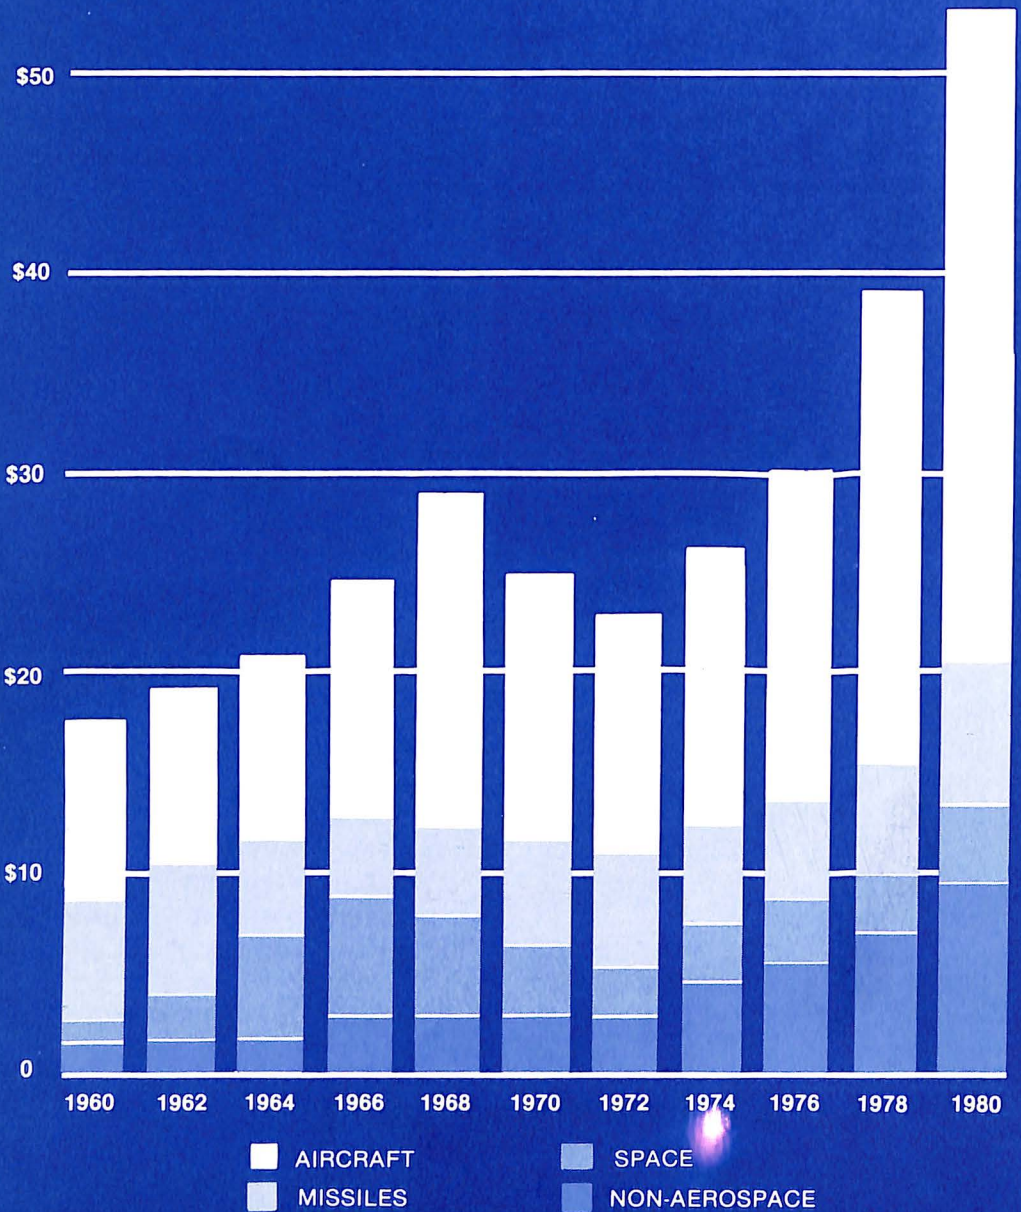

penetration by foreign plane builders of the U.S. civil aircraft market, particularly in sales of commuter-type aircraft.

Civil aerospace exports, at \$13.2 billion, represented more than 85 percent of the 1980 total. As in previous years, sales of commercial transport aircraft constituted the greatest dollar value among exports; sales of transports abroad totaled \$6.7 billion, up from \$5 billion in 1979. Military exports increased moderately, from \$2 billion in 1979 to \$2.3 billion in 1980.

Employment. Sustained activity in commercial transport manufacture was the principal factor in 1980 continuance of the upward trend in aerospace industry employment. At year-end, the industry's labor force numbered 1,218,000, an 11-year high. Average employment for the year was 1,190,000. The latter figure compares with 1,115,000 in 1979 and represents an increase during the year of 6.7 percent. That increase, however, was lower than in the previous two years, when relative annual increases of nine and 14 percent were recorded.

The number of production workers increased 6.6 percent, from 563,000 in 1979 to 600,000—roughly half the total industry labor force—in 1980. As in previous years, most production workers—357,000 or almost 60 percent—were engaged in manufacture of aircraft and related equipment. Average hourly earnings for these aircraft production workers amounted to \$9.27, up more than 12 percent over the previous year's \$8.26. Average weekly earnings increased somewhat less from \$351 to \$389.

AIRCRAFT PRODUCTION

In terms of dollar value, 1980 production of aircraft, engines, and parts reached an all-time high of \$28.9 billion, up more than 17 percent over the 1979 previous record level of \$24.6 billion.

As in the previous year, the increase was due primarily to a jump in non-government sales, which increased from \$16 billion in 1979 to \$19.4 billion in 1980, accounting for \$3.4 billion of the total \$4.3 billion aircraft sales gain. However, aircraft sales to government agencies—predominantly the Department of Defense—increased at a higher rate than in the

previous year, climbing from \$8.6 billion in 1979 to \$9.5 billion in 1980.

The traditional industry sales pattern, in which aircraft production accounts for more than half of the industry's total sales, held true in 1980, with aircraft sales representing 54 percent of the total.

The backlog of orders for aircraft, engines, and related parts also increased appreciably, ending 1980 at \$59.5 billion, compared to \$50.5 billion at the end of 1979. Here again, the boost was primarily in non-government orders, which totaled \$40.6 billion at year-end 1980. The

backlog for government orders of aircraft and related products increased \$1.6 billion, from \$17.3 billion in 1979 to \$18.9 billion at year-end 1980.

Among other aircraft production highlights:

- General aviation experienced an unusual year in which shipments dropped by more than 5,000 units yet the dollar value of sales increased. Shipments totaled 11,881, the lowest level since 1972. Shipment value increased by some \$300 million, to \$2.5 billion. The higher value of fewer deliveries is explained by the fact that much of the production drop was in relatively low-value single-engine aircraft, the area most greatly impacted by the economic downturn of 1980. Increased sales of high-value jet and turboprop business aircraft more than offset lower single-engine sales.

- The steady growth of civil helicopter production in evidence since 1976 continued. The rotary wing segment of the industry produced 1,366 civil helicopters, 347 more than in the previous year. Dollar value increased from \$403 million in 1979 to \$656 million in 1980. There was also an upturn in production of military helicopters after several years of decline: the industry delivered 187 units, valued at \$478 million, to the U.S. Government, plus 86 units, valued at \$98 million, shipped commercially to foreign governments. The comparable figures for 1979 were 158 units, valued at \$219 million, to the U.S. Government, plus 35 military units, valued at \$54 million, exported commercially.

- Civil transport sales increased but not as dramatically as in the previous year. The industry delivered 387 jetliners valued at \$9.9 billion. The comparable figures for 1979 were 376 transports worth \$8 billion.

Transport backlog at year-end amounted to \$20.8 billion in orders for 715 aircraft. This represents a decline from the previous year, when the industry had orders for 828 airplanes valued at \$21.3 billion. However, the 1980 figure does not include orders placed late in the year for which contract negotiations had not been concluded by year-end.

Transport orders from foreign customers—401 airplanes worth \$12.2 billion—accounted for more than half the total backlog, indicating continuance in immediate future years of the industry's high levels of export sales and contribution to the U.S. trade balance.

Military aircraft production increased in number of deliveries and in dollar value. The Department of Defense accepted 606 aircraft for operation by the U.S. military services, and also accepted 194 aircraft for delivery to foreign governments under Foreign Military Sales and Military Assistance Programs. The total value of DoD acceptances for U.S. military agencies and for FMS/MAP shipments, was \$5.8 billion (up \$300 million). The industry also produced 228 military-type aircraft exported commercially on a direct manufacturer-to-foreign government basis.

^a Total Obligational Authority.

46 ^E Estimate.

MISSILE PROGRAMS

In 1980, industry sales of missile systems dropped below the previous year's level but backlog increased sharply. Sales amounted to \$4.5 billion, compared with \$4.7 billion in 1979. The figures include sales of missiles systems, parts and propulsion units, but do not include funding for research, development, test and evaluation. Backlog at the end of 1980 topped \$7 billion, up more than \$1 billion from year-end 1979.

On the basis of estimated procurement authority for Fiscal Year 1981, the largest production program was the Navy's Trident 1 fleet ballistic

missile, operational since late 1979. Production of Air Force cruise missiles ranked as the second largest program. During 1980, the USAF selected the AGM-87B weapon as its Air Launched Cruise Missile and ordered start of production. Tentative plans called for eventual production of some 3,000 ALCMs, the first to become operational in 1983. Also in production and scheduled for initial operational capability in 1983 was the BGM-109 Tomahawk Ground Launched Cruise Missile. In limited production and development status was the Navy's sea-launched version

of the Tomahawk.

Principal Army missiles in production status were the Patriot air defense missile system and the US Roland short-range anti-aircraft weapon. Ordered into initial production during the year were the Army's self-propelled Multiple Launch Rocket System (MLRS), designed to neutralize enemy field artillery and air defense systems; the Navy's High-speed Anti-Radiation Missile (HARM), an air-to-surface weapon; and the Sparrow 3 AIM-7M, latest member of the air-to-air missile family used by both the USAF and the Navy.

Other major missile systems in production during 1980/81 included the Navy's Harpoon, an anti-shiping weapon launched from aircraft or surface vessels; four versions of the Standard, the Navy's fleet air defense missile; Phoenix, a Navy long range air-to-air missile; several versions of the infrared-guided Sidewinder and the radar-guided Sparrow, USAF/Navy air-to-air missiles; the Improved Hawk mobile air defense system, operational with Army, Marine Corps and NATO units; the Army Dragon, a wire-guided antitank weapon; the Army's man-portable, shoulder-fired Stinger short range anti-aircraft missile; the TOW antitank missile, being procured for the Army and the Marine Corps; and the Copperhead laser-guided, cannon-launched projectile, an Army artillery weapon fired from conventional howitzers.

Scheduled for progression from

development to production status under Fiscal Year 1982 funding are the Air Force's Imaging Infrared Maverick air-to-surface missile; the Army's Laser Hellfire, a long range helicopter-launched antiarmor weapon; and the Army's Pershing 2, a nuclear missile with greater range than the operational Pershing 1A.

Heading the list of major missiles in research and development status is the Air Force M-X mobile ICBM, intended for operational service in the late 1980s. Also in development is the Navy Trident 2 submarine launched ballistic missile, an advancement of the operational Trident 1 with greater range, heavier payload and improved accuracy. A new cruise missile program in engineering development status is the Air Force/Navy Medium Range Air-to-Surface Missile (MRASM), a variant of the Tomahawk designed for use with tactical aircraft. Intended as a replacement for the Sparrow missile in wide service use is the Advanced Medium Range Air-to-Air Missile (AMRAAM), being developed for USAF/Navy use.

A major missile-related R&D activity under Air Force cognizance is the Advanced Ballistic Re-Entry Systems (ABRES) program, designed to provide for advanced development of re-entry vehicles for use on existing or future ICBMs and sea-launched ballistic missiles; research focuses on such areas as missile nosetip erosion studies, materials development, maneuvering re-entry vehicles, decoys and other penetration aids.

SPACE PROGRAMS

U.S. space activity, in decline for more than a decade, approached an all-time low in 1980. Including NASA and military payloads, together with satellites launched by NASA for other agencies, the number of successful U.S. launches totaled only 12. Only in 1958/59, the first two years of the space program, were there fewer successful launches—seven in 1958 and 11 in 1959—and in both those years total launch attempts (including failures) topped the 1980 score.

Worldwide space launch activity approximately matched that of the previous year; there were 105 launches in 1980 compared with 106 in 1979.

The Soviet Union boosted 89 spacecraft, Japan two and India one. The all-time total of payloads delivered to Earth orbit or deep space trajectory reached 2,142, of which 1,339—more than 62 percent—were launched by the USSR. The U.S. launch total at year-end was 756.

NASA conducted seven launches during the year, but only one of them was a NASA payload; the others were launched for commercial sponsors or other government agencies who reimbursed NASA for launch costs. NASA's sole flight project was the Solar Maximum Mission spacecraft, launched February 14 to study solar

flares and their impact on Earth's environment.

NASA's other launches involved two commercial communications satellites, two military comsats and two environmental satellites. The latter, launched for the National Oceanic and Atmospheric Administration, were NOAA 7 (May 29), which failed to achieve useful orbit, and the GOES 4 (Geostationary Orbiting Environmental Satellite) launched September 9 as the initial member of a new GOES series intended to replace earlier satellites.

The two military satellites launched by NASA were FLTSATCOM 3 (January 20) and FLTSATCOM 4 (October 30). They were the third and fourth of a four-satellite USAF/Navy communications network. The commercial comsats launched were SBS-1 (November 15), the first of three Satellite Business System spacecraft designed to provide a new range of business communications, and Intelsat V F-2 (December 6), the first of nine new high-capacity satellites to be operated by the International Telecommunications Satellite Organization.

The other six U.S. launches of the year were conducted by the Air Force. The USAF launched Navstar 5 (February 9) and Navstar 6 (April 26), part of the interim Navstar Global Positioning System (GPS) designed to provide precise positioning information for naval, air and ground forces.

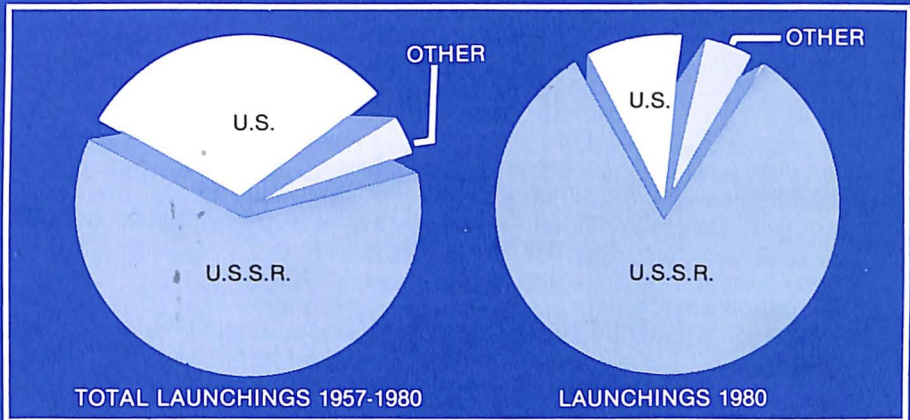

Chief among NASA/Department of Defense space development programs is the Space Shuttle, which

completed preflight testing in 1980 and was moved to the launch pad on December 29 preparatory to initial launch. (Note: The Shuttle Orbiter *Columbia* successfully completed its first orbital flight on April 14, 1981).

Among other NASA programs in development at year-end were the Space Telescope, an advanced astronomical observatory capable of peering seven times farther into space than the largest Earth-based telescopes; the International Solar Polar Mission, a NASA/European Space Agency program to investigate the still-unexplored "third dimension" of space by flying around the Sun's poles rather than in the plane of the ecliptic where all previous spacecraft have operated; the Venus Orbiting Imaging Radar, a spacecraft designed for detailed, high-resolution radar mapping of the planet Venus; and the National Oceanic Satellite System, a remote sensing system for collecting oceanographic data to satisfy both civil and defense needs.

Among the unclassified military space programs—in addition to the Space Shuttle and Navstar GPS—are the Air Force Satellite Communications System (AFSATCOM), a multi-satellite system for worldwide, survivable command and control communications; the Defense Meteorological Satellite Program (DMSP), a two satellite polar orbiting system intended to supply specialized meteorological data to support strategic missions; and the Defense Satellite Communications System (DSCS).

r Revised.

NASA MAJOR LAUNCH RECORD, 1980

Date and Designation	Objectives and Remarks
<u>Jan. 18</u> Fltsatcom 3	Third of a series of fleet communications satellites, for USAF narrow-band and wide-band communications and for USN fleet relay and broadcast channels.
<u>Feb. 14</u> Solar Maximum Mission (SMM)	To observe solar flares or other active-sun phenomena, simultaneously using five or six SMM experiments, and to measure total radiative output of sun over six-month period.
<u>May 29</u> NOAA 7	Third in a series of operational environmental monitoring satellites launched by NASA for National Oceanic and Atmospheric Administration (NOAA), for earth scanning, collection of remote observations, solar particle radiation measurements, atmospheric soundings, and data dissemination. Launch vehicle malfunction placed spacecraft in highly elliptical rather than planned circular orbit, and attempts to correct orbit unsuccessful; spacecraft unable to operate effectively, and replacement planned.
<u>Sept. 9</u> GOES 7	Fourth in a series of operational spacecraft funded by National Oceanic and Atmospheric Administration (NOAA); first of a three-satellite series to replace initial three operational satellites. To provide near-continual, high-resolution visual and infrared imaging over North and South America and surrounding oceans, to collect environmental data from up to 10,000 remote-observing platforms, to measure energetic solar field, and to broadcast centrally prepared weather and satellite information. Successfully launched by NASA and turned over to NOAA for operational use.

(Continued on next page)

NASA MAJOR LAUNCH RECORD, 1980 (Continued)

Date and Designation	Objectives and Remarks
<u>Oct. 31</u> Flitsatcom 4	Fourth of a series of planned fleet communications satellites, for USAF narrow-band and wide-band communications and for USN fleet relay and broadcast channels.
<u>Nov. 15</u> SBS 1	First in a series of three communications satellites built for Satellite Business Systems (SBS), to provide integrated, all-digital, interference-free transmission of telephone, computer, electronic mail, and video teleconferencing to SBS business and industrial clients. First U.S. domestic commercial communications satellite to use higher, less congested 12- to 14- gigahertz (K-band) frequencies. Operational control turned over to SBS.
<u>Dec. 6</u> Intelsat V F-2	First in a new series of nine satellites to be launched by NASA for the 105-member-nation International Telecommunications Satellite Organization (INTELSAT). Expected to operate as system's primary Atlantic Ocean spacecraft, to provide 12,000 voice circuits plus two television channels simultaneously. First three-axis-stabilized Intelsat satellite.

**U.S. APPLICATIONS SATELLITES
1980**

Launch Date	Name and Launch Vehicle	Remarks
COMMUNICATIONS SATELLITES		
Jan. 18	<u>Fltsatcom 3</u> Atlas-Centaur	Third in a DoD series.
Oct. 31	<u>Fltsatcom 4</u> Atlas-Centaur	Fourth in a DoD series.
Nov. 15	<u>SBS 1</u> Delta (TAT)	Launched for Satellite Business Systems as part of their domestic communications links.
Dec. 6	<u>Intelsat V (F-2)</u> Atlas-Centaur	First of a new series, positioned over the Atlantic.

WEATHER OBSERVATION

May 29	<u>NOAA 7</u> Atlas F	Failed to achieve useful orbit.
Sept. 9	<u>GOES 4</u> Delta (TAT)	Fourth of this series for NOAA.

NAVIGATION

Feb. 9	<u>Navstar 5</u> Atlas F	Global Positioning System satellite.
Apr. 26	<u>Navstar 6</u> Atlas F	Global Positioning System satellite.

^a Space vehicle systems and parts sold to other than U.S. Government customers included as of 1980; previously, this product group combined with missile systems and parts (see p. 55).
^b Includes engines and propulsion units.
^r Revised.

AIR TRANSPORTATION

After four consecutive years of setting traffic records, the U.S. scheduled airlines experienced 1980 declines in both passenger and cargo traffic. Reduced traffic volume, occasioned by higher fares and cargo rates, combined with still-climbing operating costs to erode the profit margin on domestic operations to \$7 million, down from \$130 million in 1979 and \$1 billion in 1978. The profit squeeze was even more evident in international operations, and combined figures for all services provided by U.S. certificated airlines showed an operating loss in 1980 of \$225 million,

the worst in history. The Air Transport Association viewed traffic declines and growing cost pressures with special concern because of the airlines' need to generate large amounts of capital for acquisition of quieter, more fuel-efficient aircraft essential to productive operations in the 1980s and beyond.

U.S. airlines boarded 297 million passengers in 1980 and flew them 254 billion revenue passenger miles. The figures represent drops from the previous year of about six percent and three percent respectively. Cargo ton miles flown in 1980 amounted to 7.1

billion, down 1.7 percent from 1979. Despite the declines, 1980 totals in each category were higher than in any previous year except the all-time record year of 1979.

Among other statistical highlights of the U.S. scheduled airlines' 1980 performance:

- Domestic flights accounted for 92 percent of all passengers boarded, the same as in the previous year. The airlines carried 273 million passengers on domestic routes, a decline of almost seven percent from 1979.

- International traffic was closer to the previous year's volume. Passengers carried totaled 24 million, down less than one percent.

The Air Transport Association said that significant changes in U.S. scheduled airline traffic were not expected in 1981, but that improvement in the U.S. economy and greater stability in fuel prices could bring about a return to modest profit levels.

The U.S. air carrier fleet, including operators other than scheduled airlines, numbered 3,805 aircraft at the end of 1980, 200 more than at the end of 1979. More than 2,500 of the planes were turbojet-powered and almost 700—mostly twin-engine aircraft—were turboprop-powered.

Worldwide commercial air traffic did not decline, but the growth rate was significantly lower than in recent years. World scheduled airlines, excluding those of the Soviet Union, carried 634 million passengers, only one million more than in the previous year. Passenger miles totaled 562

billion, an increase of three billion or about one-half of one percent. Cargo ton-miles flown amounted to 18.2 billion, up more than three percent.

When Soviet Union traffic is included, the same picture emerges: volume was up in all categories in 1980, but the rate of gain was lower than in earlier years. Passengers carried worldwide totaled 745 million, an increase of 10 million; passenger miles, at 665 billion, were up 14 billion; and cargo ton-miles, at close to 20 billion, were up some 700 million or more than 3.7 percent over 1979.

The world fleet of turbine engine aircraft in commercial service continued to expand at about the rate of earlier recent years, according to the Air World Survey compiled for Exxon International by Aviation Data Services, Inc. Excluding airplanes operated by the Soviet Union, the commercial fleet numbered 8,010 as of mid-year 1980, 223 more than in the previous year. The breakdown included 5,590 jet-powered aircraft, 2,059 turboprops and 195 turbine-powered helicopters.

Planes of U.S. manufacture accounted for approximately 70 percent of the total of the world's turbine engine aircraft fleet and more than 85 percent of the jet transports. In terms of jet models in service, the Boeing 727 led with 1,566 units. Rounding out the top five were the McDonnell Douglas DC-9 (856 planes), the Boeing 737 (593), the Boeing 707 (569) and the Boeing 747 (420).

HELICOPTER TRANSPORTATION

Use of the helicopter as a civil transportation vehicle continued to grow in 1980, according to the 1980/81 Directory of Helicopter Operators compiled by Aerospace Industries Association. The directory reported that the number of helicopters operated in the United States, Canada and Puerto Rico topped 8,500, an all-time high. Commercial helicopters accounted for roughly 5,600, or about 65 percent of the total.

The number of civil helicopter operators in 1980 approached 2,600, the largest group being corporate/ex-

ecutive operators. Commercial operators totaled 1,065 and there were 348 federal, state and local government operators.

The figures—for both operators and helicopters in operation—are not directly comparable with those of prior years, since computerization of data eliminated prior year duplications.

The directory shows that Canada had, in 1980, 222 operators flying 1,547 helicopters. The latter figure represents 18 percent of the combined U.S./Canadian total.

Among the states, California led in

number of helicopter operators with 271. Texas (195) was second and Florida (153) was third. In terms of numbers of helicopters in service, California again ranked first with 927 and Louisiana placed second with 692. Texas was third with 564.

There were no regularly scheduled helicopter transportation services during 1980 but—after a hiatus dating back to the spring of 1979—New York Helicopter (NYH) was preparing at year-end to launch a new service. NYH was planning to operate some 200 daily flights on weekdays and more than 100 over weekends between New York area airports and a downtown Manhattan heliport. (The service was inaugurated in January 1981).

A new U.S. civil helicopter made its flight debut in 1980. The Boeing Vertol Model 234 Commercial Chinook, a tandem-rotor high-payload transport, made its initial flight in August and certification testing proceeded on schedule. The first six Commercial Chinooks were in production at year-end and initial deliveries were planned for 1981.

Sikorsky Aircraft topped the 100 mark in deliveries of its S-76 twin-turbine helicopter, in production since 1978. By year-end, the company had orders for 432 S-76s.

Bell Helicopter Textron began deliveries of its Model 222 twin-transport. At year-end, Bell was expecting certification and planning to introduce a new four-bladed Model 412, an improved version of the company's Model 212 civil helicopter.

In the field of rotary wing research and development, there were three major flight programs—jointly sponsored by NASA and the military services—involving vehicles with both civil and military potential. Among them was the NASA/Army XV-15 Tilt Rotor Research Aircraft, whose rotors tilt forward after vertical takeoff to become propellers for cruise flight. During 1980, the XV-15 made a series of successful transitions and achieved a top forward speed of 346 miles per hour. Bell completed company testing of the Number One XV-15 and delivered it to NASA's Dryden Flight Research Center for further testing; the Number Two craft was being separately tested at NASA's Ames Research Center.

NASA was also conducting flight tests of two Sikorsky-built S-72 Rotor Systems Research Aircraft in a joint project with the Army. The S-72 was being used as a flying laboratory for test of new rotor, propulsion and other helicopter systems.

In cooperating with all the military services, NASA continued testing Sikorsky's ABC (Advancing Blade Concept) research helicopter. During the year, the craft attained a speed of more than 300 miles per hour and reached a maximum altitude of 24,700 feet, achieving two of the program's primary goals.

Boeing Vertol's Heavy Lift Helicopter research program, earlier terminated by the Army, was reinstated in 1980 with a NASA contract for development of an advanced transmission.

RESEARCH AND DEVELOPMENT

Aerospace industry expenditures for industrial research and development, including both government-funded and company-funded R&D, declined slightly in 1980. According to preliminary National Science Foundation data, aerospace expenditures amounted to \$8.3 billion, down from \$8.5 billion in the previous year.

The aerospace decline was contrary to a national trend in which R&D expenditures of most U.S. industries increased substantially in 1980. Aerospace, which led all industries in 1979 outlays, slipped to second place behind electrical machinery. Expen-

ditures for the latter industry climbed more than 16 percent in 1980 to \$8.9 billion. Total industrial R&D outlays for all U.S. manufacturing industries amounted to almost \$41 billion, up 13 percent over 1979.

Estimates for 1981 indicate that aerospace R&D expenditures will increase by roughly 10 percent to \$9.1 billion. The rate of increase, however, is well below the national average of 15 percent, according to a survey conducted by the Economics Department of McGraw-Hill Publications Company. Adjusted for inflation, national industrial R&D spending will rise

about five percent, a greater gain than in previous years.

The survey stated that all U.S. manufacturing industries anticipate increased R&D expenditures in 1981. Leading the way, with a projected level of \$11.6 billion (a 31 percent increase over 1980), is the electrical machinery industry, which will retain its top ranking. Aerospace will again rank second.

The McGraw-Hill survey also covered planned industrial R&D outlays over the period 1981-84 and found that U.S. firms generally intend to commit larger shares of their resources to R&D. From 1981 to 1984, R&D expenditures are projected to climb 41 percent to an all-industry total of \$71.1 billion. In terms of 1981-84 rate of change, the largest increases will be by general machinery (77 percent), autos/trucks (41 percent), electrical machinery (39 percent), aerospace (36 percent), instruments (36 percent) and chemicals (33 percent). In terms of projected 1984 expenditures, the five leading industries will rank in the same order as in 1980/81, led by electrical machinery (\$16.2 billion) and aerospace (\$12.4 billion).

In line with a trend evidenced since 1977, federal outlays for research and development continued to rise in Fiscal Year 1981 and are expected to increase at a higher rate in FY 1982. Estimates for FY 1981 show a total of \$33.6 billion, up more than 10 percent over FY 1980's \$30.4 billion. The Administration's FY 1982 budget plan contemplates federal R&D outlays of

\$38.3 billion, which would represent an increase over FY 1981 of 14 percent.

In the areas primarily affecting the aerospace industry, Department of Defense outlays for FY 1981 are estimated at \$15.6 billion, up more than 15 percent over the previous year's \$13.5 billion. Estimates for FY 1982 show a large DoD spending boost—more than 25 percent—to \$19.6 billion.

NASA research and development outlays for FY 1981 are estimated at \$5.1 billion, up from \$4.7 billion in FY 1980, an increase of less than nine percent which, adjusted for inflation, amounts to zero growth. Projected NASA outlays for FY 1982 (\$5.7 billion) represent an increase of 12.2 percent.

R&D outlays for the Department of Energy, at \$5 billion in FY 1981, compare with \$4.7 billion in FY 1980, a gain of less than seven percent. But in FY 1982 outlays are expected to decline to \$4.9 billion, the first annual decline since the establishment of DoE.

In FY 1981, federal outlays for aeronautical research and development will decline across the board. The total is estimated at \$2.8 billion, down \$123 million from the previous year. Department of Defense funding, at \$2.1 billion, is down \$74 million. NASA outlays of \$526 million are down by \$44 million. Aeronautics funding for the Department of Transportation (Federal Aviation Administration) is reduced by \$5 million to a total of \$87 million.

FOREIGN TRADE

In 1980, the U.S. aerospace industry recorded its highest-ever levels of exports and international trade balance. Aerospace thus contributed substantially to the nation's performance in foreign trade by offsetting to a considerable degree the adverse impacts of lagging U.S. trade in a number of other categories. Although the U.S. experienced an overall international trade deficit of \$23.4 billion, the amount of the deficit was some \$4 billion lower than in the previous year and more than \$8 billion below the all-time record deficit of 1978.

Aerospace exports amounted to \$15.5 billion, almost \$4 billion more

than the previous peak—\$11.7 billion in 1979. The aerospace trade balance for 1980, the best among U.S. manufacturing industries, was \$12 billion, up from \$10.1 billion in 1979.

The trade balance was achieved despite a sharp increase in aerospace imports that reflected strong and growing competition from foreign manufacturers, particularly in certain civil aircraft, engines, and parts categories. U.S. imports totaled \$3.6 billion, but the total figure cannot be directly compared with previous years because of changes in tariff schedules and reporting categories resulting from implementation of the

multilateral Agreement on Trade in Civil Aircraft.

However, comparison is valid in the civil aircraft category, where imports neared \$1 billion and almost doubled the previous year's level. A large part of the increase was due to further penetration by foreign manufacturers of the U.S. market for commuter-type aircraft; imports in this area have mounted steadily over the past five years, from \$41 million in 1976 to almost \$400 million in 1980.

The import value of large civil aircraft (over 33,000 pounds) increased from \$200 million in 1979 to more than \$285 million in 1980. There were also significant increases in imports of civil turbine engines, small multi-engine aircraft, and helicopters.

In terms of dollar value, civil aerospace exports constituted more than 85 percent of the 1980 total; they were valued at \$13.2 billion, compared with \$9.8 billion in 1979. The 1980 figure was composed of \$8.3 billion for complete aircraft (up \$2.1 billion); \$4.4 billion for parts, accessories and equipment (up \$1.2 billion); and \$556 million for aircraft engines (up \$181 million).

As in previous years, sales of commercial transport aircraft represented the greatest dollar value among aerospace exports. Export sales of transports totaled \$6.7 billion, up from \$5 billion in the previous year. Shipments of general aviation aircraft to foreign buyers increased from \$650 million in 1979 to \$739 million in 1980, although the number of aircraft

actually decreased 18 percent. Civil helicopter sales abroad amounted to \$299 million, up \$92 million.

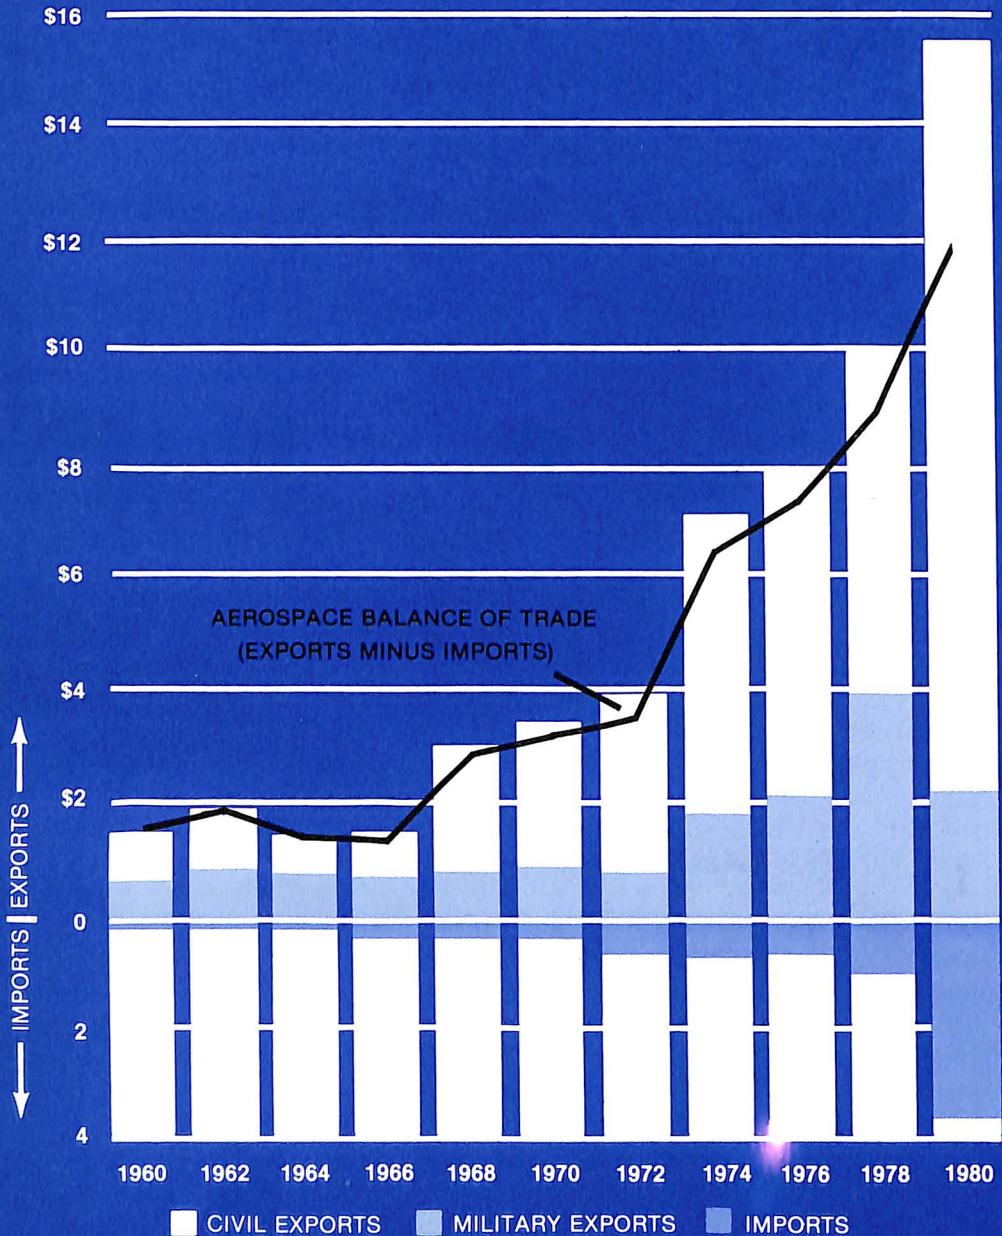

Military exports increased moderately, from approximately \$2 billion in 1979 to \$2.3 billion in 1980. Shipments of complete aircraft accounted for the largest portion of the total—\$949 million, an increase of \$111 million. There was a slight increase in exports of parts, accessories and equipment for aircraft and engines, up \$39 million to a total of \$506 million. Shipments of military aircraft engines were valued at \$63 million, a figure which roughly matched the levels of recent years.

The large backlog of orders for U.S. commercial transport aircraft indicate that aerospace exports will remain fairly high, although some declines are expected to occur in 1981-82. For later years, projections are clouded by a number of uncertainties, particularly the extent to which increasing foreign competition will reduce the U.S. share of the world market for commercial transports.

A major factor determining the success of the U.S. in sustaining its market share will be the level of loan and guarantee authority of the U.S. Export-Import Bank, whose activities contribute to American competitiveness in financing export sales of commercial transports. Also affecting U.S. share of the world market will be the government's future position on foreign trade policies and practices, which in the past have constrained overseas sales efforts.

Source: Bureau of the Census, "U.S. Imports for Consumption and General Imports, TSUSA Commodity and Country of Origin," Report FT246 (Annually).

Note: Import classifications have been revised as of 1980 data, with the total number of categories increased, and most former categories divided into military and civil items. Also effective 1980, import data include two new commodity groupings: civil aircraft parts, and aerospace products previously exported from the U.S. Excluded from aerospace trade data as of 1980 are 'Kites & Parts Thereof'; for comparability of annual data, this category has been deducted from totals for previous years.

^a Less than \$50,000.

EMPLOYMENT

In 1980, aerospace industry employment reached an 11-year high and further gains are projected for 1981 and 1982.

At year-end 1980, the industry's labor force numbered 1,218,000 and average employment for the year was 1,190,000. The gain marked continuance of an upward trend in evidence since 1978, due for the most part to heightened activity in commercial transport production. However, the 1980 rate of gain in average employment—6.7 percent—was sharply lower than in the previous two years when relative annual increases

of about nine and 14 percent were recorded.

In terms of numbers of employees, the largest gain was in aircraft manufacturing. The labor force engaged in production of aircraft, engines, parts and related equipment increased by 44,000 to a 1980 average of 655,000. Employment in missile and space activities increased to 112,000, compared with 102,000 in 1979. There was a slight increase in the communications equipment category, where employment rose from 143,000 to 146,000.

Industry-wide, the number of pro-

duction workers increased 6.6 percent, from 563,000 in 1979 to 600,000—roughly half the industry's total labor force—in 1980. As in previous years, most production workers—357,000 or almost 60 percent—were engaged in the manufacture of aircraft, engines, and parts. Average hourly earnings for these aircraft production workers amounted to \$9.27, up more than 12 percent from the previous year's \$8.26. Average weekly earnings increased somewhat less (almost 11 percent), from \$351 to \$389.

The number of scientists and engineers working on aerospace research and development programs increased once again, as it has in every year since 1976, but the increase was of lesser order than in recent years. In 1980, the aerospace scientific/engineering force numbered 88,200, up from 86,500 in 1979. Although the 1980 figure was the highest in a decade, it remained well below the 1968 peak of more than 101,000.

Aerospace R&D-engaged scientists and engineers represented 19.5 percent of all U.S. scientific/engineering personnel in R&D work. The 1980 figure compares with more than 20 percent in the two prior years and with the all-time peak of 30 percent in 1964.

The outlook for immediate future years is for continuing aerospace employment gains, but more modest growth rates. A survey conducted by Aerospace Industries Association projected a labor force of 1,234,000 by

the end of 1981 and 1,275,000 by year-end 1982. For 1981, the number of production workers was not expected to change, while all other labor categories will show only slight gains—2.6 to 2.7 percent. In 1982, production employment should increase by 1.6 percent and gains in other categories should run on the order of five percent.

Among other survey findings:

- Year-end 1981 employment in the aircraft manufacturing category will dip slightly below the 1980 level, then climb to more than 700,000 by the end of 1982. However, the number employed by prime manufacturers of commercial transport aircraft is expected to drop in both years—from 98,500 at year-end 1980 to 91,900 in 1981 and 91,300 in 1982.

- The moderate growth in missiles/space employment experienced in recent years is expected to continue in 1981/82, with increases of 1.7 and 3.8 percent.

- Employment among helicopter manufacturers, which stood at 29,800 at the end of 1980, will drop slightly in 1981—to 29,000—but increase to 30,800 by year-end 1982.

- The geographical pattern of aerospace employment is not expected to change in 1981/82. With more than 40 percent of the total, the Pacific region leads all other areas of the country by a wide margin. New England (14.6 percent) ranks second, followed by the West North Central (9.4 percent) and Middle Atlantic (9.2 percent) regions.

FINANCE

The aerospace industry's financial position remained strong in 1980 with a net profit after taxes of more than \$2.5 billion, only slightly below the peak profit of 1979.

The 1980 profit, however, was realized from a sales level substantially higher than that of the previous year. Thus, the rate of profit, measured as a percentage of sales—4.2 percent—was well below the all-time high of five percent recorded in 1979.

The decline was consistent with the experience of other U.S. industries in a year of high inflation and high interest rates. The average profit for all

U.S. manufacturing corporations amounted to 4.9 percent in 1980, down from 5.7 percent in 1979. The average for producers of non-durable goods was 5.6 percent (down from 6.1 percent) and for durable goods manufacturers four percent (down from 5.2 percent).

One major factor in the aerospace profit dip was high interest rates on borrowings necessary to finance new plant and equipment expenditures, particularly the large investment in production facilities for the new generation of commercial transport aircraft. Aerospace outlays for plant and equipment amounted to \$7 billion

in 1980, one-third greater than in the previous year. The 1980 figure compares with investments of less than \$1 billion annually in the early years of the 1970s, when interest rates were one-half to one-third those of 1980.

Despite the decline in the aerospace profit rate for 1980 the percentage was significantly higher than in most years of the prior decade. From 1970 through 1975, the industry's profit rate never reached three percent and averaged less than 2.5 percent. The figure climbed to 3.4 percent in 1976 and since then has averaged better than 4.4 percent.

A principal reason for the upward trend, according to industry analysts, was a changing ratio of government/non-government business during the decade of the seventies. At the start of the decade, sales of aerospace products and services to the federal government amounted to approximately two-thirds of the total. Thereafter, government sales gradually declined as a percentage of the total, the decline becoming more pronounced in the latter seventies. Although government sales still comprise the larger part of the total, the mix now approaches the 50-50 level. Since non-government sales usually generate higher earnings, the changing mix has elevated the overall profit rate.

The aerospace balance sheet for 1980 showed increases in total assets—up \$7.5 billion from the 1979 level to \$52 billion—and in net worth—up \$1.5 billion to \$16.8 billion. Net working capital increased from \$6.3

billion in 1979 to \$7.2 billion in 1980.

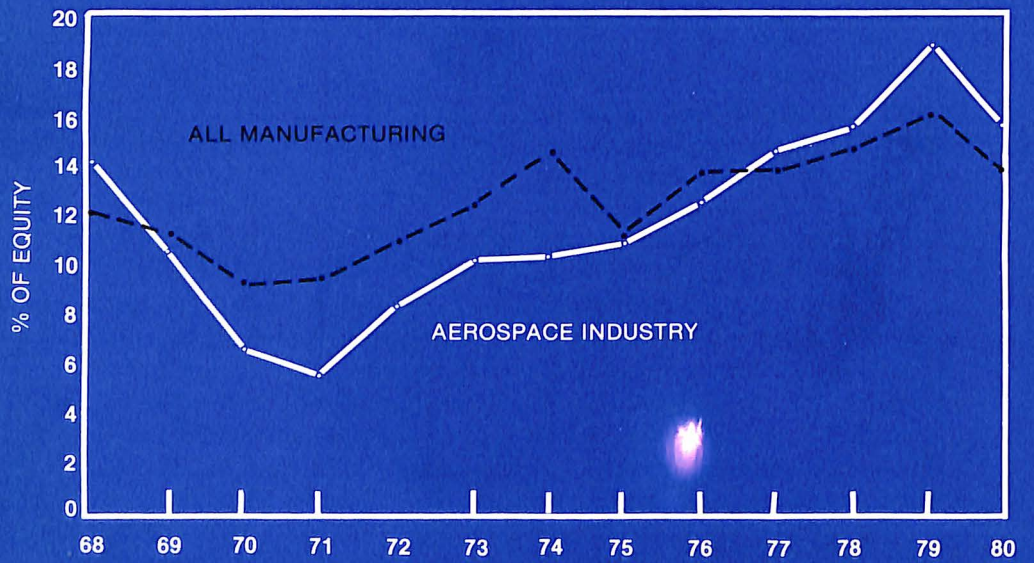

In terms of Fiscal Year 1980 contract dollar value, General Dynamics Corporation headed the list of companies awarded Department of Defense contracts. Others, in order of contract value, included McDonnell Douglas Corporation, United Technologies Corporation, The Boeing Company, General Electric Company, and Lockheed Corporation. The top three ranked the same as in the previous year.

The list of leading NASA contractors was topped by Rockwell International Corporation, followed by Martin Marietta Corporation, McDonnell Douglas Corporation, General Electric Company, Computer Sciences Corporation, Bendix Corporation, and IBM Corporation.

A geographical breakdown of major FY 1980 contracts for defense hard goods shows that the New England area led in production of aircraft-related hardware with 25.2 percent of the total dollar value. The West South Central are placed second with 18.2 percent and West North Central was third at 16.9 percent.

In contracts for missile and space systems, the Pacific area led by a wide margin with 52.5 percent. New England (13.1 percent) was second and the South Atlantic area third (8.3 percent). Pacific contractors, with 30.3 percent of the total, also led in production of electronics and communications equipment, followed by the Middle Atlantic (18.2 percent) and the South Atlantic (17 percent).

GLOSSARY

Accessions: see **Labor Turnover.**

Aeronautics: the science that treats of the operation of aircraft, also, the art or science of operating aircraft.

AIA: Aerospace Industries Association of America, Inc., formerly Aircraft Industries Association.

Aerospace Industry: the industry engaged in research, development and manufacture of aerospace systems, including manned and unmanned aircraft; missiles, space launch vehicles, and spacecraft; propulsion, guidance and control units for all of the foregoing; and a variety of airborne and ground based equipment essential to the test, operation, and maintenance of flight vehicles.

Aerospace Employment: annual average calculated as one-twelfth of sum of monthly estimates of total number of persons employed during a designated pay period by the aircraft and missile and space industries (SIC 372 and 376) plus estimated aerospace-related employment in the communications (SIC 3662) and instruments (SIC 381 and 382) industries and in certain other industries (SIC 28, 35, 73, 89, etc.).

Aerospace Payroll: estimated on the basis of average weekly earnings for a given calendar year for production workers plus an estimated annual salary for other employees.

Aerospace Sales: the AIA estimate of aerospace industry sales, developed by summing the (1) DOD expen-

ditures for procurement of aircraft and missiles; (2) estimates of DOD expenditures for RDT&E of aircraft and missiles; (3) NASA expenditures for research and development; (4) outlays for space activities by other U.S. Government departments and agencies; (5) net sales of aerospace products to other than U.S. Government; and (6) non-aerospace sales of major aerospace companies.

Air Carriers: the commercial system of air transportation, consisting of scheduled domestic and international air carriers, air taxis, air cargo operators and supplemental air carriers.

Aircraft: all airborne vehicles supported either by buoyancy or by dynamic action. Used in this volume in a restricted sense to mean an airplane — any winged aircraft, including helicopters but excluding gliders and guided missiles.

Aircraft Agreement (Agreement on Trade in Civil Aircraft): negotiated in the Tokyo Round of the Multilateral Trade Negotiations, and implemented January 1, 1980, providing for elimination of tariff and non-tariff trade barriers in the civil aircraft sector.

Aircraft Industry: the industry primarily engaged in the manufacture of aircraft, aircraft engines and parts, aircraft propellers and parts, and aircraft parts and auxiliary equipment. A sector of the **Uerospace industry**.

Airframe: the structural components of an airplane, such as fuselage, empennage, wings, landing gear, and engine mounts, but excluding such items as engines, accessories, electronics and other parts that may be replaced from time to time.

Airlines: see **Air Carriers**.

Appropriation (Federal Budget): an act of Congress authorizing an agency to incur obligations and make payments

out of funds held by the Department of the Treasury.

Assets, Net: the sum of all recorded assets after reducing such amount by allowance of reserve for bad debts, depreciation and amortization, but before deducting any liabilities, mortgages or other indebtedness.

Astronautics: the art and science of designing, building and operating manned or unmanned space objects.

Average Weekly Hours: average hours for which pay was received; different from standard of scheduled hours.

Backlog: the sales value of orders accepted (supported by legal documents) that have not yet passed through the sales account.

Budget Authority: authority provided by the Congress, mainly in the form of **Appropriations**, which allows Federal agencies to incur obligations to spend or lend money.

Bureau of the Census: an agency of the Department of Commerce.

Bureau of Economic Analysis (BEA): an agency of the Department of Commerce.

Bureau of Labor Statistics (BLS): an agency of the Department of Labor.

Constant Dollars, see Deflators.

Deflators (Constant Dollars): used to reduce a price level to that comparable with the price level at a given different time, offsetting the effect of inflation. The Gross National Product in constant dollars is arrived at by dividing components of the current dollar figures by appropriate price deflators.

Depreciation: the general conversion of the depreciable cost of a fixed asset into expense, spread over its remaining life. There are a number of methods, all based on a periodic charge to an expense account and a corresponding credit to a reserve account.

Development: the process or activity of working out a basic design, idea or piece of equipment (see **Research**).

DOD: Department of Defense.

DOE: Department of Energy.

DOT: Department of Transportation.

Durable Goods Industry: comprised of major manufacturing industry groups with SIC Codes 24, 25, and 32-39. All major manufacturing industry groups in SIC Codes 20-23 and 26-31 are considered nondurable goods manufacturing industry groups.

Earnings: the actual return to the worker for a stated period of time. Irregular bonuses, retroactive items, payments of various welfare benefits, and payroll taxes paid by employers are excluded.

Average Hourly Earnings: on a "gross" basis, reflecting not only changes in basic hours and incentive wage rates, but also such variable factors as premium pay for overtime and late shift work, and changes in output of workers paid for an incentive plan.

Average Weekly Earnings: derived by multiplying average weekly hours by hourly earnings.

ERDA: Energy, Research and Development Administration. ERDA was formed in 1974 to bring together activities previously scattered among several agencies. The major elements covered were nuclear energy, fossil energy, solar and geothermal energy, conservation through increased efficiency and environmental controls. Most of these functions were assumed by the Department of Energy as of October 1, 1977.

Establishment: the basis for reporting to the Census of Manufacturers; an operating facility in a single location.

Evaluation: (Department of Defense): determination of technical suitability of material, equipment or a system, see **RDT&E**.

Expenditures (Federal Budget): see **Outlays**.

Exports: domestic merchandise including commodities which are grown, produced, or manufactured in the United States, and commodities of foreign origin which have been changed in the United States from the form in which they were imported, or which have been enhanced in value by further manufacture in the United States, and which are traded or sold to other nations.

FAA: Federal Aviation Administration (formerly the Federal Aviation Agency), an agency of the Department of Transportation.

Facility: a physical plant or installation including real property, building, structures, improvements and plant equipment.

Fiscal Year (Federal Budget): until June 30, 1976, year beginning July 1 and ending June 30, and designated by the year in which it ends. Beginning October 1, 1976, the fiscal years run from October 1 through September 30. A three month **Transition Quarter** from July 1 through September 30, 1976, belongs to neither fiscal year.

Flyaway Value: includes the cost of the airframe, engines, electronics, communications, armament and other installed equipment.

Foreign Military Sales (FMS): export sales to foreign governments arranged through the Department of Defense, whereby DOD recovers full purchase price and administrative costs; often mistakenly used to include foreign military aid and foreign commercial sales as well.

FY: see **Fiscal Year**.

General Agreement on Tariffs and Trade (GATT): a multilateral treaty, subscribed to by over 80 governments which together account for more than four-

AEROSPACE FACTS AND FIGURES 1981/82

fifths of world trade; its aim is to liberalize world trade; the only multilateral instrument that lays down agreed rules for international trade.

General Aviation: all civil flying except that of the trunk, regional and supplemental airlines.

GNP (Gross National Product): the market value of the total output of goods and services produced by the nation's economy before deduction of depreciation charges and other allowances for business and institutional consumption of durable goods. It includes the purchase of goods and services by consumers and government, gross private domestic investment and net exports.

Helicopter: a rotary-wing aircraft which depends principally for its support and motion in the air upon the lift generated by one or more power-driven rotors, rotating on substantially vertical axes. A helicopter is a V/STOL.

Heliport: an area, either at ground level or elevated on a structure, that is used for the landing and take-off of **helicopters** and includes some or all of the various facilities useful to helicopter operations such as helicopter parking, hangar, waiting room, fueling and maintenance equipment.

Helistop: a minimum facility **heliport**, either at ground level or elevated on a structure for the landing and takeoff of **helicopters** but without such auxiliary facilities as waiting room, hangar parking, etc.

ICBM: Intercontinental Ballistic Missile, with a range of more than 5,000 miles.

Imports: classified as "general imports" or "imports for consumption." This volume refers generally to "imports for consumption," which are entries for immediate consumption plus merchandise withdrawn from bonded storage warehouses for consumption. Data are

compiled from Import Entries filed with U.S. Customs officials, and are in general based on the market value or price in the foreign country at the time of exportation of such merchandise, including the cost of containers and coverings, as well as other charges and expenses incidental to placing the merchandise in condition, packed and ready for shipment to the United States, but excluding import duties, insurance, freight and other charges incidental to arrival of the goods in the United States. The foreign values of imported merchandise are converted into U.S. currency at the rate of exchange prevailing on the day the merchandise is shipped to the United States.

Income:

Net Operating Income: total net sales (see **Sales**) less total operating costs.

Net Income (Before Income Taxes): **Net Operating Income** plus or minus "**Other Income and Expenses.**"

Other Income and Expense: includes interest income, royalty income, capital gains and losses, interest expense, cash discounts, etc.

Net Income (After Income Taxes): **Net Income (Before Taxes)** less federal income taxes.

Labor Turnover: the gross movement of wage and salary workers into and out of employed status with respect to individual establishments. This movement is divided into two broad types: **Accessions** and **Separations**. Each type of action is accumulated for a calendar month or year and expressed as a rate per 100 employees. The data relate to all employees, full-or part-time, permanent or temporary

Accessions: the total number of permanent and temporary additions to the employment roll, including both new and rehired employees.

- Separations:** terminations of employment during the calendar month or year, classified according to cause: quits, layoffs, and other separations.
- Man-Hours:** in measuring labor input, takes into account both the number of production workers and their actual hours of work. The Bureau of Labor Statistics covers all hours paid for, whether worked or not, when the employee was at the plant. One man-hour means one hour of a person's time.
- Manufacturing Industries:** those establishments engaged in the mechanical or chemical transformation of inorganic or organic substances into new products, and usually described as plants, factories, or mills, which characteristically use power-driven machines and materials handling equipment; also establishments engaged in assembling component parts of manufactured products if the new product is neither a structure nor other fixed improvement.
- Merchandise Trade Balance:** the difference between the value of U.S. goods exported to other countries and foreign goods imported into this country. The trade balance is generally regarded as "favorable" when exports exceed imports — a trade surplus — and "unfavorable" when imports exceed exports — a trade deficit.
- Military Assistance Programs (MAP):** grant aid given to qualifying countries.
- Missile:** sometimes applied to space launch vehicles, but more properly connotes automated weapons of warfare, i.e. a weapon which has an integral system of guidance, as opposed to the unguided rocket.
- Multilateral Trade Negotiations (MTN):** a forum within the GATT in which countries negotiate to overcome their trade problems. In September 1973, in Tokyo, over 100 nations launched new multilateral trade negotiations, called the "Tokyo Round," covering both tariff and non-tariff barriers to trade in industrial and agricultural products, and improvements in the GATT itself.
- NASA:** National Aeronautics and Space Administration.
- NATO:** North Atlantic Treaty Organization.
- New Obligational Authority (Federal Budget):** see **Budget Authority**.
- Non-Aerospace Products and Services:** includes all non-aircraft, non-space vehicle, and non-missile products and services produced or performed by those companies and/or establishments whose principal business is the development and/or production of aircraft, aircraft engines, missile and spacecraft engines, missiles and/or spacecraft.
- OASD:** Office of the Assistant Secretary of Defense.
- Obligations (Federal Budget):** commitments made by Federal agencies to pay out money for products, services or other purposes — as distinct from the actual payments. Obligations incurred may not be larger than budget authority.
- Other Aerospace Products and Services:** all conversions, modifications, site activation, other aerospace products (including drones) and services, basic and applied research in the sciences and in engineering, and design and development of prototype products and processes.
- Outlays:** checks issued, interest accrued on the public debt, or other payments made, net of refunds and reimbursements.
- Overtime Hours:** that portion of the gross average weekly hours which was in excess of regular hours and for which premium payments were made.

AEROSPACE FACTS AND FIGURES 1981/82

Payroll: includes the gross earnings paid in the calendar year to all employees on the payroll of operating manufacturing establishments. Includes all forms of compensation paid directly to workers such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. Does not include employers' Social Security contributions or other non-payroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

Passenger-Mile: one passenger moved one mile.

Procurement: the process whereby the executive agencies of the Federal Government acquire goods and services from enterprises other than the Federal Government.

Production Workers: includes working foremen and all non-supervisory workers (including leadmen and trainees) engaged in fabricating, processing, assembling, inspection, receiving, storage, handling, janitorial services, product development, auxiliary production for plant's own use and record keeping and services closely associated with the above production operations.

R&D: Research and Development

Research: systematic study directed toward fuller scientific knowledge or understanding of the subject studied. Research is classified as either **basic** or **applied** according to the objectives of the sponsoring agency.

Basic Research: with the objective of gaining fuller knowledge or understanding of the fundamental

aspects of phenomena and of observable facts without specific applications toward processes or products in mind.

Applied Research: with the objective of gaining knowledge or understanding necessary for determining the means by which a recognized and specific need may be met.

Development: the systematic use of scientific knowledge directed toward the production of useful materials, devices, systems, or methods including design and development of prototype and processes.

RDT&E (Department of Defense): Research, Development, Test and Evaluation.

Research: see R&D

Rotorcraft: an aircraft which in all its usual flight attitudes is supported in the air wholly or in part by a rotor or rotors, *i.e.*, airfoils rotating or revolving about an axis (see **Helicopter**).

Sales: net of returns, allowances, and discounts; the dollar value of shipments less returns and allowances, including dealer's commission, if any, which have passed through the sales account.

Satellite: a body that revolves around a larger body, such as the moon revolving around the earth, or a man-made object revolving about any body such as the sun, earth, or moon.

Separation: see **Labor Turnover**.

SIC (Standard Industrial Classification): a system developed by the U.S. Government to define the industrial composition of the economy, facilitating comparability of statistics.

Space Vehicle: an artificial body operating in outer space (beyond the earth's atmosphere).

Stockholder's Equity: assets minus all

- obligations of the corporation, except those to stockholders. Annual data are average equity for the year (using four end-of-quarter figures.) For details, see Federal Trade Commission's "Quarterly Financial Report for Manufacturing, Mining and Trade Corporations."
- STOL:** short take-off and landing aircraft.
- Test** (Department of Defense): an experiment designed to assess progress in attainment or accomplishment of development objectives (see **RDT&E**).
- Thrust:** the driving force exerted by an engine, particularly an aircraft or missile engine, in propelling the vehicle to which it is attached.
- Ton-Mile:** one ton moved one mile.
- Total Obligational Authority:** the sum of **budget authority** granted or requested from the Congress in a given year, plus unused **budget authority** from prior years.
- Trade Balance:** see **Merchandise Trade Balance**.
- Transition Quarter** (Tr. Qtr.): the three-month interval from July 1, 1976 to September 30, 1976. Beginning with the 1977 budget, the **fiscal year** (FY) runs from October 1 through September 30. To facilitate the conversion, this transition period was provided between FY 1976 and FY 1977 as a separate accounting period belonging to neither year.
- Turbine, Turbo:** a mechanical device or engine that spins in reaction to a fluid flow that passes through or over it. Frequently used in "turboprop" or "turbojet."
- U.K.:** United Kingdom.
- U.S.:** United States of America.
- USA:** United States Army, an agency of the U.S. Department of Defense.
- USAF:** United States Air Force, an agency of the U.S. Department of Defense.
- USN:** United States Navy, an agency of the U.S. Department of Defense.
- USSR:** Union of Soviet Socialist Republics.
- Utility Aircraft:** an aircraft designed for general purpose flying.
- V/STOL:** vertical short take-off and/or landing aircraft.
- Wages:** the payroll (see **Payroll**) of production and related workers.
