foreword

This 32nd edition of *Aerospace Facts and Figures* tells the statistical story of the aerospace industry in 1983, a year characterized by appreciable real sales growth with gains substantially above the inflation rate in most categories of industry activity.

It has been our practice to put the statistical information into proper perspective by comparing the industry's current performance with that of its peak years in inflation-adjusted terms. In doing so this year, we have replaced the customarily-used Gross National Product deflator with a new government-developed 'aerospace deflator' which better reflects the industry's rate of inflation.

Applying this more realistic factor, we find that aerospace industry activity in 1983—as measured by constant-dollar sales volume—was higher than in any year since 1969, although below the levels of 1967-69. Using the constant dollar measure, overall sales in 1983 amounted to an increase of some eight percent above those of the previous year. That con-

tinues the real growth pattern evident since 1978, interrupted only in 1982.

The industry's achievements in the international marketplace once again underscore the importance to the U.S. economy of high-value, high-technology aerospace exports. In 1983, the U.S. as a whole experienced the worst international trade deficit in its history—more than \$60 billion. In the same year, the aerospace industry recorded a positive trade balance of \$12.6 billion—not a record, but a performance second only to the 1981 all-time high of more than \$13 billion. There is gratifying testimony to the excellence of American aerospace products in this fact: in the first four years of the 1980s, when the U.S. suffered trade deficits totaling more than \$153 billion, the adverse impact of such deficits was substantially softened by an offsetting aerospace trade surplus of \$48.7 billion.

It is customary, when reviewing a year past, to attempt a projection for the future. Predicting tomorrow's levels of aerospace activity is a chancy matter in any year, due to the many variables involved; in this year, there is some question with regard to future defense business, normally the largest component of the industry's workload. The outcome of the national elections will obviously have significant impact on the industry's defense activity in coming years, since the opposing political factions have stated widely divergent views as to the appropriate level of national security outlays.

The outlook is generally good in the civil areas of aerospace industry activity. Congressional approval of the space station program augurs increased industry participation in NASA programs; additionally, commercial (non-NASA) space sales con-

tinue to grow and space work overall is becoming a more significant portion of the industry's total workload.

With regard to the outlook for commercial aircraft production, we note with interest the improvement of operating profits in the airline industry. That does not signal instant affluence for the airlines, because they are carrying heavy interest burdens that will erode much of the operating profit. The profit improvement is an optimistic indicator that the airline industry has turned the corner, but some airlines are still not in a position to order new airplanes. Others weathered the recent recession in better shape and they have already resumed their re-equipment programs; this is reflected in the fact that contracted orders for new transport aircraft in the first half of 1984 far exceeded the total for all of 1983. That fortifies industry predictions of substantially greater commercial aircraft manufacturing activity in the latter part of this decade.

We have a solid basis for projecting the near term in the current overall backlog. Orders on the books are at an all-time high, indicating that the industry's workload and financial posture will remain strong in the immediate future. We expect another growth year in 1984, thus closing out the first half of this decade at an activity level higher than any the aerospace industry has experienced since the late 1960s, when our companies were simultaneously engaged in the Apollo program, Vietnam war production and large-scale manufacture of wide-body jetliners.

Karl G. Harr, Jr.
President
Aerospace Industries Association

aerospace summary

In 1983, the aerospace industry recorded a significant gain in sales volume, an increase of more than 14 percent in current dollars and almost eight percent above the industry's inflation rate. The 1983 results represented a sharp rebound from the previous year, when the industry's sales increase failed to match the inflation rate due to depressed civil aircraft sales. In 1983, there were sales gains in all major categories of industry activity, including civil aircraft.

Here is a breakdown of the industry's 1983 performance:

Sales. In current dollars, total sales amounted to \$75.8 billion, up from \$66.2 billion. As is customary, sales of aircraft predominated in the breakdown by product group. At \$41.2 billion, aircraft sales were up \$5.8 billion over 1982, including a \$4.6 billion increase in military aircraft and a \$1.2 billion gain in civil aircraft sales. The dollar value of the industry's space workload increased by \$3.3 billion and missile sales edged up slightly above the previous year's level.

Aerospace sales in 1983 represented 2.3 percent of the Gross National Product (up from 2.2 percent in 1982) and 3.6 percent of total sales by all U.S. manufacturing industries (up from 3.5 percent).

In computing inflation-adjusted constant dollars, this publication departs from the previous practice of employing the GNP deflator and uses instead a more realistic aerospace composite price deflator, which has

shown a faster rate of inflation than the economy as a whole. On that basis, aerospace constant dollar sales amounted to \$27.9 billion, a figure higher than in any year since 1969 but still below the peak years of 1967-69.

Profit. The industry realized a net profit after taxes of \$2.8 billion, up from \$2.2 billion in the previous year. As a percentage of sales, the profit amounted to 3.8 percent, which compares with 3.3 percent in 1982. The 1983 profit compares with average earnings of 4.1 percent for all U.S. manufacturing corporations.

Orders and Backlog. New orders in 1983 totaled \$97.9 billion and the backlog at the end of the year amounted to \$119.8 billion, an increase over 1982 of \$14 billion. The 1983 backlog was composed of \$76.9 billion in orders from the U.S. government and \$42.9 billion in work for other customers.

As is traditional, orders for aircraft—including engines and parts—constituted the principal element of the backlog, \$64.2 billion or more than 53 percent of the total. The major backlog increases were in government orders for aircraft (\$8.4 billion) and government "other aerospace" orders; the latter category embraces conversions, modifications, ground support equipment and certain R&D contracts. There was a decline of \$2.6 billion in aircraft orders from non-government sources.

Civil Aircraft Production. In 1983, the industry shipped 3,354 civil air-

craft, some 1,700 fewer than in 1982, marking the fifth consecutive year of decline in the number of units. However, the dollar value of shipments rose by \$1.1 billion to \$9.7 billion.

As is customary, the bulk of the dollar value was in sales of commercial transports. The industry delivered 262 transports, 30 more than in 1982; their total value was \$8 billion, up from \$6.2 billion in the previous year but well below shipments in the peak year 1980 (\$9.9 billion). The backlog for commercial transports declined for the fourth consecutive year; at the end of 1983, it was \$12.6 billion, down from \$16.3 billion at the end of the previous year. Units on order totaled 352, down from 455. Of particular concern was the continuing decline in orders from foreign customers, which formerly constituted more than half of the commercial airplane backlog; at year-end 1983, they were down to 43 percent of the transport backlog value.

Civil helicopter production, which had been on the rise in the latter 1970s, continued to slip as shipments declined by 186 units to a 1983 total of 401. The dollar value was \$269 million, down from \$365 million in 1982.

Shipments of general aviation aircraft totaled 2,691, which compared with 4,266 in the previous year and almost 18,000 in the peak year, only five years earlier. The value of shipments declined from \$2 billion in 1982 to \$1.5 billion in 1983.

Military Aircraft Production. The industry produced 1,040 military aircraft; that compares with 1,159 in

1982. The 1983 total included 753 aircraft destined for use by the U.S. military services; the other 287 were military aircraft sold to foreign customers on a commercial basis, or acceptances by the Department of Defense for delivery to foreign governments under Foreign Military Sales programs.

In Fiscal Year 1983, DoD outlays for aircraft procurement totaled \$21 billion, up from \$16.8 billion in FY 1982; the estimate for FY 1984 was \$25 billion and for FY 1985 \$30.5 billion.

Missile Programs. Industry sales of missile systems, including propulsion units and R&D work, amounted to \$9.1 billion. In current dollars, this was a gain of \$261 million, but adjusted for inflation it represented a decline slightly below the 1982 level. Bureau of the Census figures on missile sales—which exclude propulsion systems and funding for research, development, test and evaluation—showed a record \$6.1 billion, up from \$5.7 billion. New orders for missile systems totaling \$7.2 billion increased the missile backlog by more than \$1 billion, to \$8.3 billion at year-end 1983.

Space Programs. Combined sales of military and civil/commercial space systems, including R&D, amounted to \$13.9 billion, an increase above the 1982 level of 32 percent. The increase was due for the most part to rapidly growing military space activities, as indicated by federal budget authority data. For FY 1983, DoD's authorization was \$8.5 billion, compared with \$6.3 billion for NASA. For FY 1984, DoD was authorized \$10.6 billion, NASA \$6.6 billion.

Non-aerospace Sales. In current

dollars, sales of non-aerospace products and services by aerospace manufacturers totaled \$11.6 billion, an increase of \$167 million. In constant dollars, however, sales declined for the second straight year.

Research and Development. In 1983, funding for aerospace R&D increased to \$16.4 billion from the previous year's \$14 billion. The total for 1984 was estimated at \$17.9 billion, including \$12.9 billion in federal funding and \$5 billion in company spending. Aerospace led all U.S. industries in the estimates for both years, and the two-year aerospace total represents 25 percent of all R&D funding (federal and company) for work performed by all U.S. business during those years. A McGraw-Hill projection for the years 1984-87 estimates that aerospace R&D will reach an annual level of \$24.5 billion by 1987 and that the aerospace industry will retain its top ranking among U.S. industries.

Foreign Trade. In 1983, the U.S. experienced an international trade deficit of more than \$60 billion. In contrast, the aerospace industry recorded a strong positive performance with a trade balance of \$12.6 billion. The trade balance topped the previous year's \$11 billion but fell short of the all-time high \$13.1 billion accomplished in 1981. Aerospace exports totaled \$16.1 billion, including civil exports of \$10.6 billion and military exports amounting to \$5.5 billion. Civil exports were up by almost \$1 billion over 1982, while military exports fell by more than half a billion dollars. The net result was a total export gain of \$462 million.

Foreign sales of transport aircraft

accounted for the greatest dollar value among civil export categories, even though transport exports were depressed in comparison with the peak levels of 1980-81. The industry delivered to foreign customers 129 commercial transports worth \$4.7 billion, compared with 121 deliveries valued at \$3.8 billion in the previous year.

Aerospace imports dropped well below the record \$4.6 billion of 1982, but remained at a relatively high \$3.4 billion.

Employment. Average employment in the aerospace industry during 1983 was 1,151,000, which was 6.2 percent of total employment in all U.S. manufacturing industries. The average figure was below the previous year's average, but an employment spurt in the last four months of 1983 brought the year-end total to 1,171,000, about 20,000 above the previous year-end figure. The upward trend continued through the first quarter of 1984. At the end of March 1984, employment reached 1,185,000.

The average number of production workers in the aerospace industry in 1983 was 522,000, a decline from 1982's 545,000. The drop was across the board, except for an increase of 5,000 workers in the missile/space category. Increasing research and development activity boosted employment among aerospace scientists and engineers engaged in R&D. They numbered (as of January 1983, the latest date for which figures are available) 99,500, an increase of more than nine percent over the previous year's 91,100.

^a "Net Total" is government-wide total less intragovernmental transactions; excludes off-budget entities.

^b "Defense" includes the military budget of DOD and other defense-related activities. Beginning in FY 1985, the Federal Budget reflects establishment of a military retirement trust fund. Defense budget data for prior years adjusted for comparable treatment of military retired pay.

^E Estimate.

Source: "The Budget of the United States Government" (Annually).

NOTE: "National Defense" includes the military budget of the Department of Defense and other defense-related activities. "TOTAL NASA" includes all categories of the NASA budget. NASA construction not included in "Aerospace Products and Services." See additional explanation with following table.

a Beginning in FY 1985 the Federal Budget reflects establishment of a military retirement trust fund. Defense budget data for prior years adjusted for comparable treatment of military retirement pay.

b Prior to 1978, DOD outlays for aircraft and missile procurement and RTD&E. Effective 1978, includes only procurement; outlays for RDT&E by product group not available.

E Estimate.

r Revised.

^p Preliminary.^E Estimate.

Key: SIC = Standard Industrial Classification. SIC 3721 = Aircraft; SIC 3724 = Aircraft Engines and Engine Parts; SIC 3728 = Aircraft Parts; SIC 3761 = Missiles and Space Vehicles; SIC 3764 = Space Propulsion; SIC 3769 = Space Equipment not elsewhere classified. Aerospace Composite aggregated by weighting individual SIC categories according to value of industry shipments.

aircraft production

In 1983, the dollar value of U.S. aircraft production increased substantially above the previous year's level, but the number of aircraft produced continued to drop, as it has in every year since 1978. The higher value for fewer airplanes is explained by sales increases in high-value commercial transports and certain military aircraft, coupled with a major production decline in the lower-priced end of the general aviation category.

Sales of aircraft, engines and parts in 1983 amounted to \$37.8 billion, a sharp rebound from the \$31.9 billion recorded in 1982 and a new all-time peak. Sales to the U.S. government, predominantly the Department of Defense, totaled \$19.6 billion, a gain of \$4.5 billion above the 1982 figure. Sales to customers other than the U.S. government also increased, after declining in 1982; they amounted to \$18.1 billion, up \$1.4 billion. This was due to the earlier mentioned gain in commercial transport sales; although activity in that area remained depressed in comparison with the levels of 1979-81, it represented a big improvement over 1982.

The industry's backlog of orders for aircraft, engines and parts climbed significantly, due to a large increase in U.S. government orders. At year-end 1983, the backlog amounted to \$64.2 billion, up from \$58.4 billion at the end of the previous year. For the first time since 1976, the backlog of orders from U.S. government customers topped the non-government backlog. Government orders, at \$34.8 billion, accounted for more than 54 percent of the total backlog; this was a reversal of the previous year's ratio, when non-government orders made up 54 percent of the total. Non-government backlog at year-end 1983 was \$29.4 billion, down from \$32 billion in 1982. Backlog data is a reflection of what has been happening to

the civil/military aircraft sales mix since the start of the decade; government backlog has doubled while non-government backlog has declined about 26 percent.

Among other 1983 aircraft production highlights:

- The industry delivered 262 commercial transports, 30 more than in 1982; their value was \$8 billion, compared with \$6.2 billion in the previous year. However, the 1983 sales value was well below the levels of the peak years 1980 (\$9.9 billion) and 1981 (\$9.7 billion). The dollar value of civil transports on order declined for the fourth straight year; at the end of 1983, it was \$12.6 billion, which compares with \$16.3 billion in 1982, \$17.2 billion in 1981, \$20.8 billion in 1980 and the all-time high of \$21.3 billion in 1979. In terms of numbers, there were orders for 352 transports on the books at year-end 1983; the comparable figures are 455 (1982), 526 (1981), 715 (1980) and 828 (1979).

Of particular concern was the drop in orders from foreign customers. For several years prior to 1981, foreign orders had constituted more than half of U.S. transport manufacturers' backlog. In 1981, and again in 1982, it was down to 45 percent of the total backlog value. In 1983, it dropped further—to 43 percent. Orders from foreign customers at year-end 1983 amounted to 139 airplanes valued at \$5.4 billion; the comparable figures for 1982 were 196 transports worth \$7.3 billion.

- Total civil aircraft shipments, including transports, numbered 3,354, the lowest figure in more than 30 years. The 1983 drop was due for the most part to a further decline in sales of general aviation aircraft. The industry delivered 2,691 general aviation units valued at \$1.5 billion; this compared with 4,266 units

worth \$2 billion in 1982. The sales decline was felt in all categories of general aviation aircraft, from single engine piston to business jets.

- Civil helicopter production, which had expanded dramatically in the decade of the 1970s, continued on the downward curve in evidence since 1980. The rotary wing segment of the industry produced 401 civil helicopters in 1983, the lowest number in more than 20 years; the figure compares with 587 in 1982 and 1,366 in the record year 1980. Dollar value in 1983 was \$269 million, down from \$365 million in 1982 and \$656 million in the peak year.

- Military aircraft production totaled 1,040 units, down from 1,159 in 1982. The U.S. military services took delivery of 753 aircraft, up 63 from the 1982 level and the highest figure since 1975; the other 287 aircraft were exports under government-to-government Foreign Military Sales programs or by direct sale from a manufacturer to a foreign government.

In Fiscal Year 1983, Department of Defense outlays for aircraft procurement totaled \$21 billion, up from \$16.8 billion in FY 1982; the estimate for FY 1984 was \$25 billion and for FY 1985 \$30.5 billion.

In 1984, DoD's major procurement programs included the USAF B-1B bomber, whose FY 1984 cost estimate was \$6.1 billion; the USAF F-16 fighter (\$2.6 billion); the Navy F/A-18 fighter (\$2.5 billion); the USAF F-15 fighter (\$1.5 billion); the USAF C-5B heavy transport (\$1.4 billion); the Army AH-64 attack helicopter (\$1.4 billion); the Navy F-14 fighter (\$1 billion); and the Navy AV-8B VTOL fighter (\$913 million).

missile programs

In line with the upward activity trend that began in 1978, industry production of missile systems increased in 1983. The Bureau of the Census reports 1983 sales of missile systems and parts, excluding propulsion and R&D, at a record level of \$6.1 billion, compared with \$5.7 billion in the previous year.

The industry received new orders totaling \$7.2 billion during 1983 and the missile backlog increased by more than \$1 billion, from \$7.2 billion in 1982 to \$8.3 billion at the end of 1983.

The Aerospace Industries Association estimates 1983 total missile sales—including propulsion units and RDT&E—at \$9.1 billion, up from \$8.8 billion in 1982.

Indications that the upward trend will continue in near-future years are contained in Department of Defense budget data for Air Force and Army missile procurement outlays (Navy data are not available). USAF/Army missile outlays for Fiscal Year 1984 are estimated at \$7 billion, an increase of more than \$2 billion above the previous year's level. Air Force procurement is \$5 billion (up \$1.6 billion) and Army outlays are \$2 billion (up \$385 million). An even larger increase is projected for FY 1985, with total USAF/Army outlays estimated at \$9.1 billion; that represents a 31 percent gain over FY 1984. The projection shows \$6.6 billion for USAF missile outlays and \$2.5 billion for Army procurement.

DoD's largest missile program is the Air Force 10-warhead Peacekeeper (MX) intercontinental ballis-

tic missile. For FY 1984, Congress authorized approximately \$2.1 billion for production of the Peacekeeper and an additional \$2 billion for development and test of the missile. The production funding provided for the first 21 of a planned 100 missiles. Initial operational service of the Peacekeeper is targeted for 1987.

On the basis of procurement plans announced by DoD, missile programs with the highest FY 1984 dollar value—other than Peacekeeper—are the Army's Patriot long-range air defense missile system (\$936 million); the Navy's Standard shipboard air defense system (\$626 million); the USAF's Ground Launched Cruise Missile (\$592 million); the Navy's Trident 1 submarine-launched ballistic missile (\$550 million); the Army's Multiple Launch Rocket System (\$545 million); the Army's Pershing II battlefield ballistic missile (\$429 million); and the Air Force's Air Launched Cruise Missile (\$422 million).

Other major missiles in production during 1983/84 include:

Army. The Laser Hellfire, a long-range helicopter-launched antiarmor weapon for both Army and Navy use; the US Roland, an American-built version of the highly mobile, short-range defense weapon for use against low-altitude targets; the man-portable Stinger, a short-range anti-aircraft missile; the Army/Marine Corps TOW 2, an antitank weapon launched from helicopters or ground vehicles; and the Copperhead laser-guided artillery projectile.

Navy. The Tomahawk long-range

cruise missile, capable of being deployed from a variety of air, surface ship, submarine and land platforms; the HARM (High Speed Anti-Radiation Missile), an air-to-surface weapon designed to destroy enemy land-based or sea-based radars; the Phoenix long-range air-to-air missile; the Marine Corps Hawk mobile air defense system, also operational with Army and NATO units; the Harpoon air-launched and sub-launched anti-shiping cruise missile, also being procured for Air Force use; the Laser Maverick short-range air-to-surface weapon for Marine Corps use in close support operations; and several versions of the infrared-guided Sidewinder and the radar-guided Sparrow missiles carried aboard Navy and USAF aircraft.

Air Force. In addition to the Peacekeeper and the cruise missile programs, production missiles under USAF cognizance include the Imaging Infrared Maverick air-to-surface missile, also being produced for Navy use; and the Rapier, an American-built version of the British short-range infrared-guided air-to-air weapon, for use on both Air Force and Navy aircraft.

Among missiles in research and development status are the AMRAAM (Advanced Medium-Range Air-to-Air Missile), a USAF/USN replacement for the Sparrow, planned for production status under FY 1985 funding; the Navy Trident 2 advanced submarine-launched ballistic missile; the Navy RAM (Rolling Airframe Missile), a system for shipboard defense against enemy antiship missiles; the Army Advanced Antitank Weapon System, a man-portable infantry weapon; and the Air Force MV (Miniature Vehicle), an antisatellite interceptor boosted by a two-stage rocket, designed for launch from fighter aircraft.

space programs

The upward trend in U.S. space activity continued in Fiscal Year 1984, according to federal budget data. Space budget authority for the Department of Defense, NASA, the National Oceanic and Atmospheric Administration (NOAA) of the Department of Commerce and other government agencies rose to \$16.7 billion in FY 1984, an increase of more than 11 percent above the FY 1983 level of \$15 billion.

The FY 1984 increase was due almost entirely to the rapidly growing military space program. DoD's budget authority for FY 1984 amounted to \$10.6 billion, compared with the previous year's \$8.5 billion. NASA received \$6.6 billion, up from \$6.3 billion in FY 1983. With NOAA operating both weather/environment and Earth resources monitoring operational satellite systems, the Commerce allocation increased to \$206 million, up \$20 million.

In constant dollars, FY 1984 marked the highest level of space budget authority since 1968. However, it remained well below the levels of the Apollo development years.

The U.S. conducted 22 space launches in calendar year 1983, including four Space Shuttle flights and 18 launches of expendable boosters; the total was four more than in the previous year. Six of the flights delivered multiple payloads; in all, there were 31 payloads sent into orbit, including four flights of the Shuttle itself, technically an orbiting research payload.

Worldwide launches into Earth orbit or beyond numbered 127, six more than in 1982. The Soviet Union conducted 98 launches, three fewer

than in the previous year. The year's other seven launches were made by Japan (3), the European Space Agency (2), India (1) and the People's Republic of China (1). The all-time total of successful launches reached 2,513 of which 1,636—65 percent—were made by the Soviet Union. The U.S. total at year-end 1983 was 814.

Among the payloads orbited were 9 classified DoD-launched space systems; unclassified systems launched by DoD were Navstar 8, a navigational satellite of the Global Positioning System, and DMSP-7, the second of an advanced series of spacecraft in the Defense Meteorological Satellite Program.

NASA launched two of its own spacecraft, the Infrared Astronomical Satellite and the TDRS-1, the first of three Tracking and Data Relay Satellites. NASA additionally launched nine communications satellites for commercial customers: Satcom 6 and 7, elements of the RCA commercial communications network; Galaxy 1 and 2, for Hughes Communications, Inc.; Intelsat V F-6, for the International Communications Satellite Organization; Anik C-2, for the Telesat Canada domestic satellite system; Palapa B-1 and Insat 1B for the governments of Indonesia and India, respectively; and Telstar 3A, for American Telephone and Telegraph Company. NASA also delivered five spacecraft for agencies of the U.S. and for foreign governments; the NOAA-8 and GOES-6 weather/environmental satellites for NOAA; the Exosat scientific satellite for the European Space Agency; the West German SPAS-01 research satellite; and a scientific satellite for the U.S.

Air Force.

NASA's principal development program is the permanently manned space station, also being studied—by Congressional mandate—as an initially-unmanned platform; definition studies began in 1984 toward operational status in the early 1990s. In preliminary development are two space station-related elements of the Space Transportation System, the Orbiting Maneuvering Vehicle and the Orbital Transfer Vehicle. Among other major programs in development or planned for early development are the Space Telescope, an advanced astronomical observatory scheduled for 1986 launch; Galileo, a Jupiter orbiter/probe also targeted for 1986 launch; the Solar Optical telescope, to be used aboard the Space Shuttle beginning in the latter 1980s; the Advanced Communications Technology Satellite, designed to increase satellite communications capacity; the Venus Radar Mapper, to be launched in 1989; the Advanced X-ray Astrophysics Facility and the Ocean Topography Experiment (TOPEX).

Among unclassified military space programs are the Navstar Global Positioning System and the advanced Defense Meteorological Satellite Program, both planned for fully operational status in 1985; the DSCS-III advanced communications network; the Milstar extremely high frequency, highly survivable communications satellite; and a program—designated SLV-X—for development of a new, standardized expendable launch vehicle. In FY 1984, DoD started work on the Strategic Defense Initiative, a comprehensive investigation of technologies that might enable future development of a defensive system capable of intercepting ballistic missiles after they have been launched.

- Source: NASA, "Aeronautics and Space Report of the President," (Annually).
- a Payloads, rather than launchings; some launches account for multiple spacecraft. Includes spacecraft from cooperating countries launched by U.S. launch vehicles.
 - b The criterion of success or failure used is attainment of earth orbit or earth escape rather than judgment of mission success. "Escape" flights include all that were intended to go at least an altitude equal to lunar distance from the earth.
 - c This earth-escape failure did attain earth orbit and therefore is included in the earth-orbit success totals.

SUCCESSFUL U.S. LAUNCHES

Calendar Year 1983

Launch Date, Spacecraft, and Launch Vehicle	Objectives and Remarks
Jan. 26 IRAS Delta 3910	SCIENTIFIC SATELLITE: to perform first all-sky survey for objects that emit infrared radiation, to provide a catalogue of infrared sources and infrared sky maps. Successfully launched by NASA; a cooperative U.S./United Kingdom/The Netherlands satellite. On-board instruments detected unidentified cold astronomical objects, bands of dust in the solar system, infrared cirrus clouds in interstellar space, infrared radiation from visually inconspicuous galaxies. Spacecraft ceased operation Nov. 21. Still in orbit.
Feb. 9 Defense (3 Satellites) Atlas H	DOD SATELLITES: to develop spaceflight techniques and technology. Spacecraft not announced. All still in orbit.
Mar. 28 NOAA 8 Atlas E	WEATHER OBSERVATION SATELLITE: to launch spacecraft into sun-synchronous orbit of sufficient accuracy to enable spacecraft to make dependable daytime and nighttime meteorological observations of the earth. Search and Rescue (SAR) instruments, provided by Canada and France, capable of detecting and locating existing emergency transmitters operating at designated frequencies. First of advanced Tiros-N (ATN) spacecraft; launched by NASA for National Oceanic and Atmospheric Administration. Stretched version of original Tiros-N series. Spacecraft attitude control problem corrected Apr. 18 and became operational June 20, 1983.
Apr. 4 Challenger (STS 6) TDRS-1 (Apr. 4) Space Shuttle	SPACE TRANSPORTATION SYSTEM: second operational flight, to deploy TDRS-1, to accomplish assigned experiments and test objectives. Successfully accomplished first spacewalk (extravehicular activity, or EVA) in over 9 years, with 3½ hour duration. COMMUNICATIONS SATELLITE: TDRS-1, deployed from cargo bay, is the first of three Tracking and Data Relay Satellites (TDRS). Launch intended to place satellite in a stationary geosynchronous orbit location with sufficient stationkeeping propulsion fuel on-board to meet support requirements and to initiate user support services, and to provide improved tracking and data acquisition services to spacecraft in low earth orbit. IUS-1 (inertial upper stage) anomaly prevented TDRS-1 from being delivered to geosynchronous orbit as planned. Subsequent actions by TDRS-1 attitude control system enabled satellite to arrive at synchronous altitude. Satellite provided support during flight of STS-9/Spacelab-1.
Apr. 11 RCA-Satcom 6 Delta 3924	COMMUNICATIONS SATELLITE: to provide TV, voice channels, and high speed data transmission to Alaska, Hawaii, and contiguous U.S., to replace RCA-Satcom 1 launched in 1975. Second in a new series of communications satellites launched by NASA for RCA.

(Continued on next page)

SUCCESSFUL U.S. LAUNCHES 1983 (Continued)

<p>Launch Date, Spacecraft, and Launch Vehicle</p>	<p>Objectives and Remarks</p>
<p><u>Apr. 15</u> Defense Titan IIIB</p>	<p>DOD SATELLITE: to develop spaceflight techniques and technology. Spacecraft not announced. Reentered Aug. 21.</p>
<p><u>Apr. 28</u> GOES 6 Delta 3914</p>	<p>WEATHER OBSERVATION SATELLITE: to provide near-continual high-resolution, visual and infrared imaging over North and South America and surrounding oceans. Successfully launched by NASA for National Oceanic and Atmospheric Administration (NOAA). Joins GOES 5, launched May 1981 as part of two-satellite operational system. Apogee-boost motor fired Apr. 30; arrived on station May 12; turned over to NOAA May 27; became operational Jun. 1.</p>
<p><u>May 19</u> Intelsat V F-6 Atlas-Centaur</p>	<p>COMMUNICATIONS SATELLITE: to provide 12,000 voice circuits and 2 color TV channels simultaneously, double the capacity of Intelsat IV-A series. Sixth of a series of nine satellites. Launched by NASA for 108-member-nation International Telecommunications Satellite Organization (INTELSAT). Positioned over Atlantic Ocean.</p>
<p><u>May 26</u> EXOSAT Delta 3914</p>	<p>SCIENTIFIC SATELLITE: successfully launched by NASA for the European Space Agency, with sufficient accuracy to allow spacecraft to accomplish its scientific mission of continuous observations of X-ray sources. Returning data.</p>
<p><u>Jun. 9</u> Defense (2 Satellites) Atlas H</p>	<p>DOD SATELLITES: to develop spaceflight techniques and technology. Spacecraft not announced. Both still in orbit.</p>
<p><u>Jun. 18</u> Challenger (STS 7) Anik C-2 (Jun. 18) Palapa B-1 (Jun. 19) SPAS 01 (Jun. 22) Space Shuttle</p>	<p>SPACE TRANSPORTATION SYSTEM: third operational flight, to launch Anik C-2 (Telesat F) and Palapa B-1, accomplish assigned experiments and test objectives. Successfully deployed both satellites, carried out experiments including launching and recovering SPAS 01. SATELLITES: Anik C-2 (COMMUNICATIONS SATELLITE) successfully launched by NASA for Telesat Canada, for communications coverage over Canada. Palapa B-1 (COMMUNICATIONS SATELLITE) successfully launched for the Republic of Indonesia for domestic communications. SPAS 01 (Shuttle Pallet Satellite) successfully deployed and retrieved, performed scientific experiments, tested remote manipulator arm, and photographed Challenger.</p>
<p><u>Jun. 20</u> Defense (2 Satellites) Titan 34D</p>	<p>DOD SATELLITES: to develop spaceflight techniques and technology. Spacecraft not announced. Both still in orbit.</p>
<p><u>Jun. 27</u> P83-1 (HILAT) Scout</p>	<p>SCIENTIFIC SATELLITE: launched successfully by NASA for the USAF, to enable the achievement of Air Force mission objectives, to evaluate certain propagation effects of disturbed plasmas on radar and communication systems. Still in orbit.</p>
<p><u>Jun. 28</u> Galaxy 1 Delta 3920</p>	<p>COMMUNICATIONS SATELLITE: successfully launched by NASA for Hughes Communications, Inc., with sufficient accuracy to allow spacecraft to achieve stationary geosynchronous orbit.</p>

(Continued on next page)

SUCCESSFUL U.S. LAUNCHES 1983 (Continued)

Launch Date, Spacecraft, and Launch Vehicle	Objectives and Remarks
Jul. 14 Navstar 8 Atlas E	NAVIGATION SATELLITE: Global Positioning System satellite, successfully launched and still in orbit.
Jul. 28 Telstar 3A Delta 3920	COMMUNICATIONS SATELLITE: successfully launched by NASA for American Telephone and Telegraph Co., with sufficient accuracy to allow PAM-D (payload assist module) and spacecraft propulsion system to place spacecraft into stationary geosynchronous orbit.
Jul. 31 Defense Titan IIIB	DOD SATELLITE: to develop spaceflight techniques and technology. Spacecraft not announced. Still in orbit.
Aug. 30 Challenger (STS 8) Insat 1B (Aug. 31) Space Shuttle	SPACE TRANSPORTATION SYSTEM: fourth operational flight, to deploy Insat 1B, and to accomplish assigned experiments and test objectives. Successfully deployed satellite from cargo bay. First night launch and landing. COMMUNICATIONS SATELLITE: Insat 1B successfully launched by NASA for Government of India. Stuck solar array corrected. Satellite operational over equator south of India.
Sep. 8 RCA-Satcom 7 Delta 3924	COMMUNICATIONS SATELLITE: successfully launched by NASA for RCA, third in a series of advanced satellites, to replace RCA-Satcom 2, launched in 1976.
Sep. 22 Galaxy 2 Delta 3920	COMMUNICATIONS SATELLITE: second in a series of three satellites successfully launched by NASA for Hughes Communications, Inc., with sufficient accuracy to allow the PAM-D (payload assist module) and spacecraft propulsion system to place spacecraft into a stationary geosynchronous orbit above the equator.
Nov. 18 DMSP 7 Atlas E	WEATHER OBSERVATION SATELLITE: second in a series of the Defense Meteorological Satellite Program (DMSP), to provide full earth observation coverage twice daily. Still in orbit.
Nov. 28 Columbia (STS 9) Space Shuttle	SPACE TRANSPORTATION SYSTEM: fifth operational flight, to verify the Spacelab system and subsystem performance capability, to determine the Spacelab/orbiter interface capability, and to measure the induced environment. Secondary objectives were to obtain scientific, applications and technology data from U.S./European multi-disciplinary payload and to demonstrate, to user community, broad capability of Spacelab for scientific research. First flight of Spacelab, consisting of a long tunnel and a long module-plus-one pallet, scientific airlock and spacelab window adapter assembly. Carried on Spacelab 1 were more than 70 experiments in five areas of scientific research: astronomy and solar physics, space plasma physics, atmospheric physics and earth observations, life sciences, and materials science. First flight of 6-person crew, first flight of a payload specialist, and first flight of a non-American on a Shuttle mission.

U.S. MANNED SPACE FLIGHT LOG

Calendar Year 1983

Launch Date	Spacecraft and Crew	Flight Time (days:hrs:min)	Highlights
Apr. 4	Space Shuttle Challenger (STS 6) Piloted by Astronauts Paul J. Weitz Karol J. Bobko Mission Specialists: Donald H. Peterson Story Musgrave	5:00:24	Sixth flight of Space Transportation System, second operational flight. TDRS-1 satellite deployed from cargo bay. First spacewalk (extravehicular activity, or EVA) in over 9 years.
Jun. 18	Space Shuttle Challenger (STS 7) Piloted by Astronauts Robert L. Crippen Frederick H. Hauck Mission Specialists: John M. Fabian Sally K. Ride Dr. Norman Thagard	6:02:24	Seventh flight of Space Transportation System, third operational flight. Successfully deployed two satellites (Anik C-2 and Palapa B-1); carried out experiments including launching and recovering SPAS 01 (Shuttle Pallet Satellite). Tested remote manipulator arm and photographed Challenger. First flight with five crewmembers.
Aug. 30	Space Shuttle Challenger (STS 8) Piloted by Astronauts Richard H. Truly Daniel C. Brandenstein Mission Specialists: Dale A. Gardner Guion S. Bluford Dr. William Thornton	6:01:09	Eighth flight of Space Transportation System, fourth operational flight. Launched Insat 1B satellite from cargo bay. First night launch and landing.
Nov. 28	Space Shuttle Columbia (STS 9) Piloted by Astronauts John W. Young Brewster W. Shaw Mission Specialists: Owen K. Garriott Robert A. R. Parker Payload Specialists: Byron K. Lichtenberg Ulf Merbold	10:07:47	Ninth flight of Space Transportation System, fifth operational flight. First flight of Spacelab 1, first flight with six crewmembers, first flight with payload specialists. West German Merbold was first non-U.S. astronaut to fly in U.S. space program.

a Space vehicle systems and parts sold to other than U.S. Government customers included as of 1980; previously, this product group combined with missile systems and parts.

b Based on aerospace composite price deflator (1972 = 100).

c AIA estimate based on MQ37D data.

r Revised.

air transportation

Record levels of passenger and cargo traffic, coupled with improved yields, enabled the U.S. airline industry to record its first operating profit in four years, but heavy interest burdens and other factors kept net income in the red. Nonetheless, the year was viewed as an encouraging turnaround. On the basis of results for the early months of 1984, the Air Transport Association predicted a solid operating profit for 1984—perhaps as much as \$1.5 billion—but added that net profits will be far below that figure.

According to data compiled by the Civil Aeronautics Board, U.S. air carriers had a 1983 operating profit of \$425 million on operating revenues of \$38.2 billion. These figures compare with a 1982 record loss of \$739 million on revenues of \$36.1 billion. The 1983 profit was due to a strong performance in international operations, where the airlines achieved an operating profit of \$493 million, compared with a loss of \$17 million in the previous year. In domestic operations, the industry sustained an operating loss of \$131 million, which compares with a \$750 million loss in 1982.

Traffic on U.S. scheduled air service increased sharply in 1983. In domestic operations, carriers boarded 296 million passengers and flew them 226 billion passenger miles. Both figures are all-time highs; they compare with 274 million passengers flown 210 billion passenger miles in 1982. The revenue passenger load factor for 1983 was 59.9 percent, up from 58.5 percent. Domestic flights accounted for 93 percent of all passengers boarded by U.S. airlines in 1983, same as a year earlier. U.S.

carriers also flew 7.6 billion revenue ton miles of cargo, a record; the figure for the previous year was 6.9 billion.

International traffic increased after three years of decline. Passengers enplaned by U.S. airlines on international routes totaled 21.9 million, up from 19.8 million in 1982. Revenue passenger miles amounted to 54.8 billion, up from 49.5 billion in 1982. The passenger load factor in international service was 64.3 percent, compared with 61.4 percent in 1982.

U.S. air carriers, including operators other than scheduled airlines, were flying 4,203 multi-engine aircraft at the end of 1983; the figure represent an increase of 131 planes over 1982. Turbojet aircraft numbered 2,767, about 66 percent of the total; the fleet also included 876 turboprops, 551 piston-engine aircraft and nine helicopters.

Worldwide commercial air traffic also recorded substantial gains in 1983. Airlines of the 152 member states of the International Civil Aviation Organization boarded 782 million passengers, which compares with 758 million in 1982, and flew them 730 billion passenger miles, 24 billion more than in 1982. The passenger load factor was 65 percent, up from 64 percent. ICAO airlines also carried 13.1 million tons of freight and accomplished 23.5 billion freight ton miles; the comparable figures for the previous year were 12.5 million tons, 21.4 billion ton miles.

The world fleet of turbine-engine aircraft in airline service increased by 423 airplanes, according to the annual survey conducted by Exxon International. The gain was due in part to an increase in the number of

airlines listed in the survey, which grew from 615 to 687. As of March 31, 1983, the world fleet—excluding planes operated by the Soviet Union, totaled 9,643 aircraft, the highest number ever reported by the survey; it compares with 9,220 in the previous year. Of the total, 6,462—67 percent—were turbojets, 187 more than in 1982; 2,956 were turboprops (up 259) and there were 225 turbine-powered helicopters (down 23).

Of the 9,643 aircraft in the world airline fleet, 6,440—66.8 percent—were of U.S. manufacture; the percentage compares with 67.5 percent in the previous survey. Of the 6,462 turbojet-powered transports, 5,458—84.5 percent—were built in the U.S.; the latter figure compares with 84.9 percent in 1982. Only 795 of the 2,956 turboprops listed—26.9 percent—were of U.S. manufacture; the comparable figures for 1982 were 685 and 25.4 percent. Of the 225 turbine-powered helicopters in service, 187—83.1 percent—were produced in the U.S.; this represented a drop from 87.9 percent in the previous year.

At the end of 1983, the U.S. air transportation system included 16,029 civil and joint civil/military-use airfield facilities in the U.S., Puerto Rico, the U.S. Virgin Islands and the Pacific territories. A breakdown shows 12,653 airports, 5,628 of them for public use and 7,025 for private use; 2,918 heliports (124 public, 2,794 private); 66 stolports (10 public, 56 private); and 392 seaplane bases (225 public, 167 private). Texas led the list with 1,543 facilities of all types, followed by Illinois (909), California (862), Pennsylvania (720), Ohio (678) and Alaska (615). The total number of facilities was 198 higher than in the previous year.

a 16,029 aircraft facilities consist of 12,653 airports (5,628 for public use and 7,025 for private use), 2,918 heliports (124 for public use and 2,794 for private use), 66 stolports (10 for public use and 56 for private use), and 392 seaplane bases (225 for public use and 167 for private use). Included in these data are facilities having joint civil-military use.

b 'Public' refers to use, whether publicly or privately owned.

c American Samoa, Guam, and Trust Territories.

Source: Federal Aviation Administration, "FAA Statistical Handbook of Aviation," (Annually).

NOTE: Effective 1978, includes certified route air carriers, supplemental air carriers (charters), and all aircraft over 12,500 pounds operated by air taxis, commercial operators and travel clubs. Effective 1979, includes multi-engine aircraft in passenger service of commuters. "Active aircraft" must have a current U.S. registration and have been flown during the calendar year.

a Aircraft in use by foreign airlines and registered in the United States to carry passengers between two U.S. cities.

r Revised. Data in previous editions included single-engine piston aircraft.

NOTE: Detail may not add to totals because of estimating procedures.

a Before 1971, an active aircraft was one certified as eligible to fly. Currently, an "active aircraft" must have a current U.S. registration and have been flown during the previous calendar year.

b Effective 1978, includes certificated route air carriers, supplemental air carriers (charters), and all aircraft over 12,500 pounds operated by air taxis, commercial operators and travel clubs. Effective 1979, includes multi-engine aircraft in passenger service of commuters.

c Includes autogiros; excludes air carrier helicopters.

d Includes gliders, dirigibles and balloons.

a Glider and lighter-than-air pilots are not required to have a medical examination; however, the totals above are the pilots who received a medical.

b No periodic medical examination required; therefore, no determination as to current activity can be made.

c Special ratings shown on pilot certificates represented above, not additional certificates.

helicopter transportation

Although production of new helicopters was at its lowest level in more than two decades, use of the helicopter as a civil transportation vehicle continued to grow in 1983/84, as evidenced by an increase in the number of helicopter facilities in operation. The number reached 4,232 in the spring of 1984, according to the 1984 AIA Directory of Heliports/Helistops in the United States, Canada and Puerto Rico; the directory is compiled and published by Aerospace Industries Association.

The 4,232 facilities includes land-based heliports and helistops, but not offshore oil rigs in American waters, which are separately reported. The figure for 1984 compares with 3,985 facilities in 1981, the last prior year in which the directory was published. Of the 1984 total, 385 are rooftop facilities and 3,847 are at ground level. Only 333—eight percent—of the total 4,232 facilities are for public use, 15 fewer than in 1981; 1,071 are hospital heliports/helistops and there are 2,789 private or "prior permission" facilities that are available for public use in emergencies.

The Middle Atlantic region of the United States led the nation in heliport/helistop availability with 793 facilities in the 1984 survey; this compares with 727 in 1981. In second place was the East North Central region with 640 (down 78). Facilities in the Pacific region fell by more than 100 to 634, dropping Pacific from first place in 1981 to third in 1984. Other regions ranking high in heliport/helistop availability were West South Central (551) and South Atlantic (511). Canada had 147 facilities, Puerto Rico 65.

The 1,071 hospital heliports/helistops represent an increase of more than 18 percent over the 905 reported in 1981. The geographical distribution among hospitals differs from the national pat-

tern. The East North Central region, although its number of facilities remained the same at 193, held on to first place. In second was South Atlantic, which added 41 facilities since the 1981 survey; third was the Pacific region with 167 (up 32).

The 1984 survey showed 78 hospitals operating helicopter ambulance services, compared with 46 in 1981. In addition, police and transportation agencies in eight states and the District of Columbia provide emergency helicopter ambulance service, and there are 23 other states that have one or more agencies operating ambulance helicopters.

In addition to the 4,232 land facilities reported in the survey, there were helicopter facilities aboard 261 offshore oil rigs as of May 1984. More than 90 percent of them were located in the Gulf states of Louisiana, which had 171 offshore facilities, and Texas, which had 66. Inclusion of offshore platforms would bring the grand total of U.S. helicopter facilities to 4,493.

The increase in the number of heliports/helistops reflects not only greater activity in traditional employment of the helicopter, but also growth in a variety of new business uses and destinations. In addition to the customarily large users of rotary wing services—hospitals, police/fire departments, oil producers, newspapers and TV stations—there are now facilities at hotels, motels, garages, shopping centers, department stores, convention centers, colleges and universities, companies engaged in insurance, construction, steel manufacture and mining, cosmetic firms and even prison farms and zoos. In some metropolitan areas, public helistops (like bus stops) provide ready access to downtown business districts.

In 1983, the rotary wing segment of the aerospace industry produced 401 civil

helicopters, down from 587 in 1982 and the lowest number in 20 years. Dollar value in 1983 was \$269 million, down from \$365 million in 1982 and \$656 million in the peak year 1980. Major commercial helicopter types in production included the Sikorsky S-76 and Bell Helicopter Textron Model 222 twin-turbine transports, the Boeing Vertol 44-passenger Model 234, the Bell 206 and the Hughes 500. Bell Helicopter Textron started development of the Model 400 TwinRanger, a seven-seater with a four-blade main rotor made of composite materials, to be produced in Canada; first deliveries were planned for 1985. Bell also introduced to service with hospitals the Med/Air 222UT medical transport.

Among other industry development of 1983/84,

- Hughes Helicopters, Inc. and Schweizer Aircraft Corporation completed an agreement whereby Schweizer manufactures and provides product support for the Hughes Model 300 series helicopters. Schweizer delivered the first Model 300C in July 1984. Hughes' 500E was selected as the official helicopters for the Los Angeles Olympics.

- Bell Helicopter Textron was selected by the Canadian government to establish a helicopter industry in Canada. The company also announced formation of the Singapore-based Bell Helicopter Asia, a joint venture of Bell Helicopter Textron and Inchcape Aviation Corporation of Singapore.

- Sikorsky Aircraft and the Spanish firm Construcciones Aeronauticas, S.A. (CASA) signed an agreement to establish a long-term helicopter industrial cooperation program in Spain. Sikorsky also concluded an arrangement whereby its S-61 helicopter, no longer built in the U.S. will be produced in Italy under license by Agusta S.p.A.

a Latest available data.

research and development

National spending for aerospace research and development, including both federal and company funding, will increase substantially in 1984, according to estimates by McGraw-Hill Publications Company. Total aerospace R&D funding will amount to \$17.9 billion, which compares with \$16.4 billion in 1983. The 1984 figure is compounded of \$12.9 billion in federal funding and \$5 billion in company funds; comparable figures for the previous year were \$11.8 billion (federal) and \$4.6 billion (company).

In terms of percentages, aerospace R&D increased by 16.7 percent in 1983 and will go up an additional 9.4 percent in 1984. In both cases, the increases are well above the average gain for all U.S. business, which was estimated by McGraw-Hill as 11.1 percent in 1983 and 8.3 percent in 1984.

The 1983/84 aerospace figures represent 25 percent of R&D funding (federal and company) for work performed by all U.S. businesses during those years. The McGraw-Hill estimate for all-industry R&D funding in 1984, including company money and federal funding, is \$71 billion. Aerospace (\$17.9 billion) ranks first among U.S. industries in 1984, as it did in 1983. Second in the 1984 estimates is the electrical machinery industry at \$15.2 billion, followed by non-electrical machinery (\$8.8 billion), chemicals (\$8.2 billion) and automotive (\$6.1 billion).

McGraw-Hill's projection for the longer term indicates that industrial R&D growth will be on the order of nine percent annually (all-industry average) in the period 1984-87. The survey estimates that aerospace expenditures will reach \$24.5 billion a year by 1987 and that aerospace will continue to lead U.S. industries. The 1984-87 aerospace increase will amount to 36.6 percent, compared with

an average for all U.S. businesses of 27.2 percent.

McGraw-Hill's estimates, combined with historical data supplied by the National Science Foundation, indicate that aerospace R&D funding increased more rapidly over the first four years of this decade than did all-industry R&D. The 1983 aerospace total is almost double the 1980 level; the all-industry gain over the same span is about 60 percent.

Government budget estimates show large FY 1984/85 increases in federal outlays for all research and development activities, including industry-performed and government-performed R&D. The estimate for FY 1984 is \$42.7 billion, up \$6.1 billion—16.8 percent—above the FY 1983 level. Overall federal outlays in FY 1985 are estimated at \$48.7 billion, which would amount to an increase of 14 percent. The increases are due for the most part to sharply climbing R&D outlays by the Department of Defense. DoD outlays in FY 1984 are estimated at \$25.3 billion, up from \$21.1 billion in the previous year. The projected figure for FY 1985 is \$31.1 billion, which would mean a gain of almost 23 percent.

A DoD analysis of outlays for defense research, development, test and evaluation (RDT&E) shows that the Air Force is conducting by far the greatest RDT&E effort, as measured by dollar value. Air Force outlays for FY 1984 amount to \$11.8 billion, compared with \$6.8 billion for the Navy and \$4 billion for the Army. The rankings remain the same in a projection for FY 1985, which estimates Air Force outlays at \$13.6 billion, the Navy's at \$8.6 billion and the Army's at \$4.6 billion.

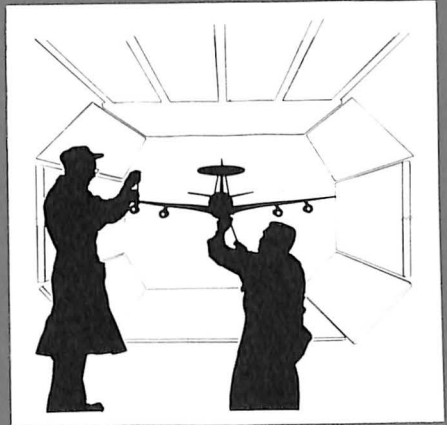

In FY 1983, the latest year for which data are available, DoD awarded prime contracts for RDT&E totaling \$16.3 bil-

lion, up from \$14.9 billion in the previous year. A breakdown shows that missile/space work was the largest area of RDT&E activity, with contract awards totaling \$6.4 billion. Other elements of the breakdown include \$4.7 billion for electronic and communications equipment, \$2.1 billion for aircraft and \$3.1 billion in all other RDT&E categories.

Pacific coast contractors—including business firms, educational institutions and other non-profit institutions—dominated a geographical breakdown with 44.5 percent of FY 1983 DoD contract awards for RDT&E. In second place was the South Atlantic region (12.4 percent) and in third New England (11.2 percent).

NASA funding for R&D activities increased sharply from \$2.5 billion in FY 1983 to \$3.5 billion in FY 1984. A budget projection for FY 1985 shows a decline in NASA R&D to \$3.3 billion, reflecting reduced R&D on the Space Shuttle, which will become fully operational with the 1985 introduction to service of the fourth Orbiter, *Atlantis*. NASA R&D outlays are expected to climb significantly in the latter years of this decade as the space station program gains momentum.

Federal budget authority for aeronautics R&D continued on the upward curve in evidence since 1980. Total FY 1983 budget authority for DoD, NASA and the Federal Aviation Administration (Department of Transportation) amounted to \$4.3 billion, up from \$3.6 billion in the previous year; almost all of the increase was in DoD funding, \$3.7 billion, up \$680 million. Estimates for FY 1984 show total budget authority of \$5 billion, about 14 percent above the FY 1983 level. A breakdown for FY 1984 lists DoD budget authority at \$4.1 billion (up \$415 million), NASA at \$589 million (up \$36 million) and the FAA at \$286 million, more than double the previous year's figure.

Source: National Science Foundation, for historical data and All Industries estimates; McGraw-Hill Publications Company for Aerospace Industry Total estimates; AIA for Aerospace Industry Federal/Company estimates.

NOTE: Detail may not add to totals because of rounding.

- a Includes all manufacturing industries, plus those non-manufacturing industries known to conduct or finance research and development.
- b Companies classified in SIC codes 372 and 376, having as their principal activity the manufacture of aircraft, guided missiles, space vehicles, and parts.
- c Company funds include all funds for industrial R&D work performed within company facilities except funds provided by the Federal Government. Excluded are company-financed research and development contracted to outside organizations such as research institutions, universities and colleges, or other non-profit organizations.
- d The McGraw-Hill estimates for All Industries are \$65.516 million for 1983 and \$70.962 million for 1984.
- e Based on GNP implicit price deflator.
- f Estimate.
- r Revised.

foreign trade

In 1983, the United States experienced an international trade deficit of \$60.7 billion, an all-time high and the eighth consecutive annual deficit.

In contrast, the aerospace industry recorded a strong positive trade performance, with exports of \$16.1 billion and a trade balance of \$12.6 billion. Both figures fell short of the record levels of 1981, but they were higher than any other year in history.

The 1983 aerospace trade balance was compounded of a moderate (3 percent) increase in export sales and a sharp drop in imports (more than 24 percent). The \$12.6 billion trade balance compares with \$11 billion in 1982 and \$13.1 billion in the record year 1981.

The composition of the aerospace export volume represented a turnaround from the previous year's experience. In 1982, the industry suffered a sharp drop in exports due to low levels of civil aircraft sales, particularly airline transports; the civil export drop was partially offset by record levels of military exports. In 1983, the reverse was true: civil exports increased by almost \$1 billion while military exports fell off by more than half a billion dollars. The net result was a total export gain over the previous year of \$462 million.

In 1983, aerospace exports amounted to 8.2 percent of total U.S. exports; this compares with 7.5 percent for the previous year and an average of 7.2 percent for the five year span 1978-82. The 1983 export volume (\$16.1 billion) included military exports of \$5.5 billion and civil

exports totaling \$10.6 billion.

Foreign deliveries of transport aircraft accounted for the greatest dollar value among civil exports, even though transport sales were depressed in comparison with the high levels of 1980-81. The industry delivered 129 commercial transports worth \$4.7 billion; the figure compares 121 deliveries worth \$3.8 billion in 1982.

Exports of general aviation aircraft, in decline for several years, fell off again in 1983. In terms of dollar value, sales dropped from \$517 million in 1982 to \$356 million in 1983; in numbers, deliveries declined from 940 to 519. Exports of civil helicopters increased in dollar value (up \$26 million to \$232 million), but the number of units delivered was down by 38 to 216.

Among other categories of civil aerospace exports, sales of aircraft engines—at \$950 million—were up \$187 million over 1982, and exports of aircraft and engine parts dropped \$43 million to \$3.95 billion.

The military export volume was made up of \$1.8 billion in deliveries of complete aircraft, down from \$2.4 billion in 1982; \$172 million in aircraft engines (up \$32 million); \$2.5 billion in aircraft and engine parts (up \$118 million); and \$994 million in guided missiles, rockets and parts (down \$132 million). As is usually the case, the largest element of complete aircraft exports was the fighter/fighte bomber category. The industry delivered 93 such aircraft valued at \$1.4 billion; the comparable figures

for 1982 were 154 fighters/fighter-bombers worth \$1.5 billion. Total military aircraft delivered to foreign customers numbered 936, statistically an increase of almost 300 units over 1982, but this was an anomaly; it was due to sales in very large numbers of used or rebuilt aircraft whose combined dollar value represented only a very small portion of the total.

Aerospace imports dropped considerably below the record \$4.6 billion of 1982, but nonetheless remained at a relatively high level of \$3.4 billion. Foreign deliveries to U.S. customers of aircraft engines and parts accounted for \$1.1 billion, down from \$1.3 billion in 1982. Imports of complete aircraft amounted to \$899 million, virtually all of them in the civil aircraft category; the figure compares with \$1.3 billion in 1982. By far the largest category, in dollar value terms, was imports of general aviation aircraft; however, at \$542 million, this category showed a substantial reduction from the \$838 million worth of general aviation planes imported in 1982. In terms of numbers, the U.S. imported 162 general aviation aircraft, down from 274 in the previous year. Imports of civil helicopters (100) were numerically well below the 1982 level (184) but slightly higher in dollar terms; the value of 1983 helicopter imports was \$89 million, up from \$85 million in 1982.

In dollar terms, the leading nation in sales of general aviation aircraft to U.S. customers was Canada (\$208 million), followed by the United Kingdom (\$137 million), France (\$104 million) and Israel (\$32 million). France led in civil helicopter sales to U.S. customers (\$40 million) with Germany (\$36 million) second.

Source: Export-Import Bank of the United States.

NOTE: Detail may not add to totals because of rounding.

^a Discount Loans excluded from loan lending authority limitation until FY 1981. Comparable authorization data for 1980 and prior years are therefore listed under Total Direct Loans, which include Direct Credits, CFF and Relending Loans. For 1981 and subsequent years, compare TOTAL Loans authorization data with Lending Authority, both of which include Discount Loans. The value of Total Direct Loans may exceed Lending Authority because of the inclusion in Total Direct Loans of the full amount of Certificates of Loan Participation (COLPs), portions of which are subsequently sold to commercial banks.

^b CFF (Cooperative Financing Facility) program discontinued after 1981.

^c Effective 1981, lending authority includes discount loans as well as direct loans.

^d Limitation for Guarantees and Insurance began in 1981.

^E Estimate.

NA Not available.

Source: Export-Import Bank of the United States.

^a Includes complete aircraft, engines, and parts.

^b Includes business aircraft, general aviation aircraft, helicopters, and related goods and services.

^c Loans are commitments for direct financing by the Export-Import Bank to foreign buyers of U.S. equipment and services, including Direct Credits and loans authorized under the Cooperative Financing Facility (CFF), until the termination of the CFF program in 1981, but excluding Discount Loans, which are made by the Export-Import Bank to commercial banks and which subsequently may be guaranteed by the Export-Import Bank, in which case the value of the loans is included with Guarantees.

^d Guarantees by the Export-Import Bank provide assurances of repayment of principal and interest on loans made by private lending institutions, such as commercial banks, for major export transactions.

NOTE: Detail may not add to totals because of rounding.

- ^a Loans are commitments for direct financing by the Export-Import Bank to foreign buyers of U.S. equipment and services, including Direct Credits and loans authorized under the Cooperative Financing Facility (CFF) until the termination of the CFF program in 1981, but excluding Discount Loans, which are made by the Export-Import Bank to commercial banks and which subsequently may be guaranteed by the Export-Import Bank, in which case the value of the loans is included with Guarantees.
- ^b Guarantees by the Export-Import Bank provide assurances of repayment of principal and interest on loans made by private lending institutions, such as commercial banks, for major export transactions.
- ^c First year of commercial jet aircraft authorizations.

employment

Strictly speaking, the aerospace industry's average employment in 1983 declined below the level of the previous year. Average employment was 1,151,000, down 11,000 from 1982's average of 1,162,000. The 1983 figure represented 6.2 percent of total employment in all U.S. manufacturing industries, the same percentage as in 1982.

However, use of the average employment figure—which is customary in this publication—is misleading in this instance, because it indicates an aerospace industry employment decline where actually the labor force was on the rise in the latter part of 1983 and the early months of 1984. The inconsistency is due to the fact that the average employment figure includes eight months of stagnant employment levels (January through August) that lowered the year's average even though industry employment increased substantially in the other months (September through December).

By year-end 1983, after four consecutive monthly increases, industry employment totaled 1,171,000—some 20,000 above the year's average employment figure or the prior year-end figure. The work force continued to grow during the first quarter of 1984, reaching a total at the end

of March of 1,185,000. That represented the highest industry employment level since January 1982, when employment began to decline because of reduced levels of civil aircraft production, particularly commercial transport production.

On the averaging basis, employment among companies manufacturing aircraft, engines and parts fell off by 21,000 to a 1983 average of 580,000. An employment gain of 11,000—to an average of 143,000—was recorded among companies fabricating missiles and space systems, while the work force engaged in production of avionics grew by 2,000 to an average of 161,000. The "other parts and equipment" category dropped by 3,000 to a year's average of 267,000. Using year-end rather than average statistics, each of the industry segment figures was slightly higher, but there was still a net reduction in the number of workers engaged in aircraft, engines and parts production. Despite the reduction, aircraft manufacture continued to account for approximately half of the total industry labor force.

The number of production workers in the aerospace industry (on the annual average basis) declined slightly more than four percent, from 545,000 in 1982 to 522,000 in 1983. The drop was across the board, except for an

increase of 5,000 workers in the missile/space segment.

Increasing research and development activity resulted in an employment gain among aerospace scientists and engineers engaged in R&D work. They numbered (as of January 1983, the latest date for which statistics are available) 99,500, an increase of more than nine percent over the previous year's 91,100. In 1983, the aerospace scientist/engineer component represented 18.6 percent of all scientists and engineers employed in R&D capacities by all U.S. industries. The 1983 aerospace increase in scientists/engineers was greater than the all-industry experience: an increase from 510,000 in 1982 to 536,000 in 1983, a gain of about five percent.

The aerospace industry fared well in a Department of Labor survey of occupational injuries and illnesses in 1982 (latest data available), with injury and illness rates far below those of all U.S. manufacturing industries. The all-industry average for the year was 10.2 injury/illness cases, causing 75 lost workdays, for each 100 full-time workers. By contrast, employees in the aircraft and parts segment of the aerospace industry experienced only six cases causing 37 lost workdays. The rate in the missile/space segment was even lower: 2.7 cases, 19 lost workdays.

a Includes estimates of manpower for hardware and related contracts, as well as actual work-years for support service contracts.

E Estimate.

finance

In 1983, the aerospace industry recorded a net profit after taxes of \$2.8 billion. The figure compares with \$2.2 billion in the previous year and with the all-time high of \$3 billion earned in 1981.

Expressed as a percentage of sales, the profit rate was 3.8 percent in 1983, up from 3.3 percent in 1982. The aerospace improvement was consistent with the experience of U.S. manufacturers in general, whose average profit rate increased substantially over 1982 as the nation's economic recovery gained momentum. The 1983 aerospace rate compares with an average profit of 4.1 percent for all U.S. manufacturing corporations.

Measured as a percentage of assets, the 1983 aerospace profit was 4.5 percent, up from 3.7 percent in the previous year; as a percentage of equity, it amounted to 13.9 percent, up from 12 percent. While aerospace profit rates measured as percentages of sales or assets are usually well below the average for all manufacturing corporations, they have been consistently higher than the all-industry average in recent years when measured as a percentage of equity. The reason, in one industry view, is not that aerospace equity has fallen, but that aerospace profits have climbed more rapidly than industry as a whole in the years since 1977. The improved profitability is due to a variety of factors, including high levels of activity in virtually all aerospace categories.

Aerospace plant and equipment expenditures dipped in 1983 to \$4.9

billion; the figure compares with \$6 billion in 1982, \$6.4 billion in 1981 and \$7 billion in 1980, the latter an all-time record. The declines in 1982 and 1983 matched similar declines among U.S. manufacturing industries in general. However, estimates of aerospace plant and equipment outlays in 1984 indicated a rise of almost 11 percent to \$5.5 billion; this compares with various projections ranging from 9.9 percent to 16.9 percent for U.S. business as a whole.

The aerospace balance sheet for 1983 showed an increase in total assets—up \$4 billion to \$63.4 billion—and in total stockholders' equity—up \$2.6 billion to \$21 billion. Net working capital increased from \$7.9 billion in 1982 to \$8.1 billion in 1983.

In terms of contract dollar value, General Dynamics Corporation retained its ranking at the top of the list of companies awarded Department of Defense contracts during Fiscal Year 1983. General Dynamics received contracts valued at \$6.8 billion; McDonnell Douglas Corporation placed second (same ranking as in the previous year) with \$6.1 billion. Rockwell International Corporation moved up from eighth place in 1982 to third in 1983, with contracts worth \$4.54 billion. Rounding out the top 10 were General Electric Company (\$4.51 billion); The Boeing Company (\$4.4 billion); Lockheed Corporation (\$4 billion); United Technologies Corporation (\$3.9 billion); Tenneco Inc. (\$3.8 billion); Hughes Aircraft Company (\$3.2 billion); and Raytheon Company (\$2.7 billion). With the exception of Tenneco, all were in the top 10 in the preceding year.

A Department of Defense analysis of FY 1983 prime contract awards by geographic region showed the Pacific region atop the list in three aerospace categories—aircraft, missile/

space systems, and electronics/communications equipment. The Pacific region led in aircraft-related contracts with awards totaling \$6.4 billion, 22.7 percent of the total. In second place was the West North Central region with \$5.2 billion in contracts, 18.6 percent. The New England area was third in the aircraft category with \$3.8 billion, 13.6 percent.

In missiles/space, the Pacific region dominated with \$7.5 billion, 46.9 percent of the total. New England had \$2.07 billion (12.9 percent) and the South Atlantic region \$2.06 billion (12.8 percent). Pacific led the electronics/communications category with \$6.3 billion and 33.2 percent, followed by South Atlantic (\$3.5 billion-plus, 18.7 percent) and Middle Atlantic (\$3.5 billion, 18.5 percent).

Heading the list of NASA prime contractors in FY 1983 was Rockwell International Corporation. Rockwell, which has topped the list every year since the start of the Space Shuttle program, received contracts valued at \$1.6 billion. Martin Marietta Corporation, which has been the second largest NASA contractor for several years, was again second with contracts totaling \$466 million. Morton Thiokol, Inc. moved up to third place (from fourth in the preceding year) with contracts worth \$268 million. McDonnell Douglas Corporation (\$237 million) dropped from third to fourth, and General Dynamics Corporation (\$156 million) remained in fifth place. The rest of the top 10 included Computer Sciences Corporation (\$147 million); Bendix Corporation (\$137 million); United Technologies Corporation (\$116 million); IBM Corporation (\$116 million); and United Space Boosters, Inc. (\$115 million). All of the latter companies had been in the top 10 in the preceding year.

NOTE: Detail may not add to totals because of rounding.

^a Data represent prime contract awards over \$25,000, effective 1983, and over \$10,000 for previous years.

^b Includes Alaska and Hawaii.

glossary

Aeronautics: the science that treats of the operation of aircraft, also, the art or science of operating aircraft.

AIA: Aerospace Industries Association of America, Inc., formerly Aircraft Industries Association.

Aerospace Industry: the industry engaged in research, development and manufacture of aerospace systems, including manned and unmanned aircraft; missiles, space launch vehicles, and spacecraft; propulsion, guidance and control units for all of the foregoing; and a variety of airborne and ground based equipment essential to the test, operation, and maintenance of flight vehicles.

Aerospace Employment: annual average calculated as one-twelfth of sum of monthly estimates of total number of persons employed during a designated pay period by the aircraft and missile and space industries (SIC 372 and 376) plus estimated aerospace-related employment in the communications equipment (SIC 3662) and instruments (SIC 381 and 382) industries and in certain other industries (SIC 28, 35, 73, 89, etc.).

Aerospace Payroll: estimated on the basis of average weekly earnings for a given calendar year for production workers plus an estimated annual salary for other employees.

Aerospace Sales: the AIA estimate of aerospace industry sales, developed by summing the (1) DOD expenditures for procurement of aircraft and missiles; (2) estimates of DOD expenditures for RDT&E of aircraft and missiles; (3) NASA expenditures for research and development; (4) outlays for space activities by DOD and other U.S. Government departments and agencies; (5) net sales of aerospace products to other than U.S. Government, including

civil aircraft products (domestic sales and exports), commercial sales of space-related equipment, and exports of missiles and military aircraft (both commercial and FMS); and (6) non-aerospace sales of major aerospace companies.

Air Carriers: the commercial system of air transportation, consisting of domestic and international scheduled and charter service.

Aircraft: all airborne vehicles supported either by buoyancy or by dynamic action. Used in this volume in a restricted sense to mean an airplane—any winged aircraft, including helicopters but excluding gliders and guided missiles.

Aircraft Agreement (Agreement on Trade in Civil Aircraft): negotiated in the Tokyo Round of the Multilateral Trade Negotiations, and implemented January 1, 1980, providing for elimination of tariff and non-tariff trade barriers in the civil aircraft sector.

Aircraft Industry: the industry primarily engaged in the manufacture of aircraft, aircraft engines and parts, aircraft propellers and parts, and aircraft parts and auxiliary equipment. A sector of the **Aerospace Industry**.

Airframe: the structural components of an airplane, such as fuselage, empennage, wings, landing gear, and engine mounts, but excluding such items as engines, accessories, electronics and other parts that may be replaced from time to time.

Airlines: see **Air Carriers**.

Appropriation (Federal Budget): an act of Congress authorizing an agency to incur obligations and make payments out of funds held by the Department of the Treasury.

Assets, Net: the sum of all recorded assets after reducing such amount by allowance of reserve for bad debts, depreciation and amortization, but before deducting any liabilities, mortgages or other indebtedness.

Astronautics: the art and science of designing, building and operating manned or unmanned space objects.

Average Weekly Hours: average hours for which pay was received; different from standard or scheduled hours.

Backlog: the sales value of orders accepted (supported by legal documents) that have not yet passed through the sales account.

Budget Authority: authority provided by the Congress; mainly in the form of **Appropriations**, which allows Federal agencies to incur obligations to spend or lend money.

Bureau of the Census: an agency of the Department of Commerce.

Bureau of Economic Analysis (BEA): an agency of the Department of Commerce.

Bureau of Labor Statistics (BLS): an agency of the Department of Labor.

Constant Dollars, see Deflator.

Deflator: index used to convert a price level to one comparable with the price level at a different time, offsetting the effect of inflation. The base period, which equals 100, is usually specified as either a given fiscal or calendar year. **Constant Dollars** are calculated by dividing current ('then-year') dollars by appropriate price deflator, and multiplying by 100.

Depreciation: the general conversion of the depreciable cost of a fixed asset into expense, spread over its remaining life. There are a number of methods, all based on a periodic charge to an expense account and a corresponding credit to a reserve account.

Development: the process or activity of working out a basic design, idea or piece of equipment (see **Research**).

DOD: Department of Defense.

DOE: Department of Energy.

DOT: Department of Transportation.

Durable Goods Industry: comprised of

major manufacturing industry groups with SIC Codes 24, 25, and 32-39. All major manufacturing industry groups in SIC Codes 20-23 and 26-31 are considered nondurable goods manufacturing industry groups.

Earnings: the actual return to the worker for a stated period of time. Irregular bonuses, retroactive items, payments of various welfare benefits, and payroll taxes paid by employers are excluded.

Average Hourly Earnings: on a "gross" basis, reflecting not only changes in basic hourly and incentive wage rates, but also such variable factors as premium pay for overtime and late shift work, and changes in output of workers paid for an incentive plan.

Average Weekly Earnings: derived by multiplying average weekly hours by hourly earnings.

ERDA: Energy, Research and Development Administration. ERDA was formed in 1974 to bring together activities previously scattered among several agencies. The major elements covered were nuclear energy, fossil energy, solar and geothermal energy, conservation through increased efficiency and environmental controls. Most of these functions were assumed by the Department of Energy as of October 1, 1977.

Establishment: the basis for reporting to the Census of Manufacturers; an operating facility in a single location.

Evaluation: (Department of Defense); determination of technical suitability of material, equipment or a system; see **RDT&E**.

Expenditures (Federal Budget): see **Outlays**.

Exports: domestic merchandise including commodities which are grown, produced, or manufactured in the United States, and commodities of foreign origin which have been changed in the United States from the form in which they were imported, or which have been enhanced in value by further

manufacture in the United States, and which are traded or sold to other nations.

FAA: Federal Aviation Administration (formerly the Federal Aviation Agency), an agency of the Department of Transportation.

Facility: a physical plant or installation including real property, building, structures, improvements and plant equipment.

Fiscal Year (Federal Budget): until June 30, 1976, year beginning July 1 and ending June 30, and designated by the year in which it ends. Beginning October 1, 1976, the fiscal years run from October 1 through September 30 and are designated by the year in which they end. A three month **Transition Quarter** from July 1 through September 30, 1976, belongs to neither fiscal year.

Flyaway Value: includes the cost of the airframe, engines, electronics, communications, armament and other installed equipment.

Foreign Military Sales (FMS): export sales to foreign governments arranged through the Department of Defense, whereby DOD recovers full purchase price and administrative costs; often mistakenly used to include foreign military aid and foreign commercial sales as well.

FY: see **Fiscal Year**.

General Agreement on Tariff and Trade (GATT): a multilateral treaty, subscribed to by over 80 governments which together account for more than four-fifths of world trade; its aim is to liberalize world trade; the only multilateral instrument that lays down agreed rules for international trade.

General Aviation: all civil flying except that of air carriers.

GNP (Gross National Product): the market value of the total output of goods and services produced by the nation's economy before deduction of depreciation charges and other allowances for business and institutional consumption of durable goods. It includes

the purchase of goods and services by consumers and government, gross private domestic investment and net exports.

Helicopter: a rotary-wing aircraft which depends principally for its support and motion in the air upon the lift generated by one or more power-driven rotors, rotating on substantially vertical axes. A helicopter is a **V/STOL**.

Heliport: an area, either at ground level or elevated on a structure, that is used for the landing and take-off of **helicopters** and includes some or all of the various facilities useful to helicopter operations such as helicopter parking, hangar, waiting room, fueling and maintenance equipment.

Helistop: a minimum facility **heliport**, either at ground level or elevated on a structure for the landing and takeoff of **helicopters** but without such auxiliary facilities as waiting room, hangar parking, etc.

ICBM: Intercontinental Ballistic Missile, with a range of more than 5,000 miles.

Imports: classified as "general imports" or "imports for consumption." This volume refers generally to "imports for consumption," which are entries for immediate consumption plus merchandise withdrawn from bonded storage warehouses for consumption. Data are compiled from Import Entries filed with U.S. Customs officials, and are in general based on the market value or price in the foreign country at the time of exportation of such merchandise, including the cost of containers and coverings, as well as other charges and expenses incidental to placing the merchandise in condition, packed and ready for shipment to the United States, but excluding import duties, insurance, freight and other charges incidental to arrival of the goods in the United States. The foreign values of imported merchandise are converted into U.S. currency at the rate of exchange prevailing on the day the merchandise is shipped to the United States.

Income:

Net Operating Income: total net sales (see **Sales**) less total operating costs.

Net Income (Before Income Taxes): **Net Operating Income** plus or minus "**Other Income and Expenses.**"

Other Income and Expenses: includes interest income, royalty income, capital gains and losses, interest expense, cash discounts, etc.

Net Income (After Income Taxes): **Net Income (Before Taxes)** less federal income taxes.

Manufacturing Industries: those **establishments** engaged in the mechanical or chemical transformation of inorganic or organic substances into new products, and usually described as plants, factories, or mills, which characteristically use power-driven machines and materials-handling equipment; also establishments engaged in assembling component parts of manufactured products if the new product is neither a structure nor other fixed improvement.

Merchandise Trade Balance: the difference between the value of U.S. goods exported to other countries and foreign goods imported into this country. The trade balance is generally regarded as "favorable" when **exports** exceed **imports**—a trade surplus—and "unfavorable" when **imports** exceed **exports**—a trade deficit.

Missile: sometimes applied to space launch vehicles, but more properly connotes automated weapons of warfare, *i.e.*, a weapon which has an integral system of guidance, as opposed to the unguided rocket.

Multilateral Trade Negotiations (MTN): a forum within the **GATT** in which countries negotiate to overcome their trade problems. In September 1973, in Tokyo, over 100 nations launched new multilateral trade negotiations, called the "Tokyo Round," covering both tariff and non-tariff barriers to trade in industrial and ag-

ricultural products, and improvements in the **GATT** itself.

NASA: National Aeronautics and Space Administration.

NATO: North Atlantic Treaty Organization.

New Obligational Authority (Federal Budget): see **Budget Authority**.

Non-Aerospace Products and Services: products and services other than aircraft, missiles, space vehicles, and related propulsion and parts, produced or performed by establishments whose principal business is the development and/or manufacture of aerospace products.

OASD: Office of the Assistant Secretary of Defense.

Obligations (Federal Budget): commitments made by Federal agencies to pay out money for products, services or other purposes—as distinct from the actual payments. Obligations incurred may not be larger than **budget authority**.

Orders, Net New: the sales value of new orders (supported by legal documents) minus cancellations during the period.

Other Aerospace Products and Services: all conversions, modifications, site activation, and other aerospace products (including drones) and services, plus research and development under contract, defined as basic and applied research in the sciences and in engineering, and design and development of prototype products and processes.

Outlays: checks issued, interest accrued on the public debt, or other payments made, net of refunds and reimbursements.

Overtime Hours: that portion of the gross average weekly hours which was in excess of regular hours and for which premium payments were made.

Payroll, All Manufacturing: includes the gross earning paid in the calendar year to all employees on the payroll of operating manufacturing **establish-**

ments. Includes all forms of compensation paid directly to workers such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. Does not include employers' Social Security contributions or other non-payroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

Passenger-Mile: one passenger moved one mile.

Procurement: the process whereby the executive agencies of the Federal Government acquire goods and services from enterprises other than the Federal Government.

Production Workers: includes working foremen and all non-supervisory workers (including leadmen and trainees) engaged in fabricating, processing, assembling, inspection, receiving, storage, handling, janitorial services, product development, auxiliary production for plant's own use and record keeping and services closely associated with the above production operations.

R&D: Research and Development.

Research: systematic study directed toward fuller scientific knowledge or understanding of the subject studied. Research is classified as either **basic** or **applied** according to the objectives of the sponsoring agency.

Basic Research: with the objective of gaining fuller knowledge or understanding of the fundamental aspects of phenomena and of observable facts without specific applications toward processes or products in mind.

Applied Research: with the objective of gaining knowledge or understanding necessary for determining the means by which a recognized and specific need may be met.

Development: the systematic use of scientific knowledge directed toward

the production of useful materials, devices, systems, or methods including design and development of prototype and processes.

Independent Research and Development (IR&D): a term devised by the Department of Defense and used by Federal agencies to differentiate between a contractor's research and development technical effort performed under a contract, grant, or other arrangement (R&D) and that which is self-initiated and self-funded (IR&D).

Industrial Research and Development: research and development work performed within company facilities, funded by company or Federal funds, and excluding company-financed research and development contracted to outside organizations such as research institutions, universities and colleges, or other non-profit organizations.

RDT&E: (Department of Defense): Research, Development, Test and Evaluation.

Research: see R&D.

Rotorcraft: an aircraft which in all its usual flight attitudes is supported in the air wholly or in part by a rotor or rotors, *i.e.*, airfoils rotating or revolving about an axis (see **Helicopter**).

Sales: net of returns, allowances, and discounts, the dollar value of shipments, including dealer's commission, if any, which have passed through the sales account.

Satellite: a body that revolves around a larger body, such as the moon revolving around the earth, or a man-made object revolving about any body such as the sun, earth, or moon.

SIC (Standard Industrial Classification): a system developed by the U.S. Government to define the industrial composition of the economy, facilitating comparability of statistics. See **Aerospace Industry** for explanation of SIC codes applicable to the aerospace industry.

Space Vehicle: an artificial body operating in outer space (beyond the earth's atmosphere).

Stockholder's Equity: assets minus all obligations of the corporation, except those to stockholders. Annual data are average equity for the year (using four end-of-quarter figures.) For details, see "Quarterly Financial Report for Manufacturing, Mining and Trade Corporations," compiled by the Bureau of the Census.

STOL: short take-off and landing aircraft.

Test (Department of Defense): an experiment designed to assess progress in attainment or accomplishment of development objectives (see **RDT&E**).

Thrust: the driving force exerted by an engine, particularly an aircraft or missile engine, in propelling the vehicle to which it is attached.

Ton-Mile: one ton moved one mile.

Total Obligational Authority: the sum of **budget authority** granted or requested from the Congress in a given year, plus unused **budget authority** from prior years.

Trade Balance: see **Merchandise Trade Balance**.

Transition Quarter (Tr. Qtr.): the three-month interval from July 1, 1976 to September 30, 1976. See **Fiscal Year**.

Turbine, Turbo: a mechanical device or engine that spins in reaction to a fluid flow that passes through or over it. Frequently used in "turboprop" or "turbojet."

U.K.: United Kingdom.

U.S.: United States of America.

USA: United States Army, an agency of the U.S. Department of Defense.

USAF: United States Air Force, an agency of the U.S. Department of Defense.

USN: United States Navy, an agency of the U.S. Department of Defense.

USSR: Union of Soviet Socialist Republics.

Utility Aircraft: an aircraft designed for general purpose flying.

V/STOL: vertical short take-off and/or landing aircraft.
