The U. S. Aerospace Team

Pride and Purpose

The U.S. aerospace workforce is a world class team. Smart, skilled, and resourceful, they are the people behind the products—those that move us ahead in commercial aviation and space, and those that help America defend freedom at home and around the world. They are the people who helped make victory in Desert Storm possible.

The U.S. aerospace team is committed to innovation, to new products and processes, to doing things better than yesterday. The team is 1.2 million strong, and dedicated to making tomorrow possible.

91-92

Foreword

For the U.S. aerospace industry, 1990 was a year remarkably similar to its predecessor in that the industry set new records for sales, backlog, export volume and trade balance.

But there was one significant difference: In 1989, the flow of new orders surged to an all-time high; in 1990, new orders declined for the first time since 1986.

The reduction in total new industry orders was significant — 15 percent. It was occasioned almost entirely by a sharp downward plunge — nearly 30 percent — in orders from the U.S. Government, meaning, for the most part, orders for defense systems.

That fact exemplifies what the industry can expect from the decade of the 1990s: a continuing real-term decline in the defense sales level, offset to a degree by high levels of sales in non-defense areas.

On the positive side, 1990 overall sales not only set a record but eclipsed the prior record by an impressive 14 percent. The principal factor in that record performance was a big increase in non-military sales, in particular, sales of commercial transport aircraft.

Despite the decline in U.S. Government orders, the industry's overall backlog grew appreciably, to \$264 billion at year-end 1990, a gain close to \$12 billion. Orders from non-government sources constituted nearly two-thirds (65 percent) of the backlog.

Space sector sales continued their steady rise and reached a new record level. In dollar terms, space business amounted to a solid 22 percent of total sales. The indicated future growth

of the industry's space workload offers a good measure of compensation for declining defense activity.

The importance to the U.S. economy of high value, high technology aerospace exports was underscored once again by the industry's record performance in foreign sales and trade balance. In a year in which the U.S. as a whole experienced a trade deficit of \$101 billion, U.S. aerospace exports

number of calls for defense cuts below the levels envisioned by the Administration plan. At the moment of writing, however, there has been no concerted action toward drastic cuts below the appropriation levels planned by the Administration.

AIA expects further downward pressure on the defense budget but not reductions of disastrous dimension. Therefore, the association stands by its

amounted to more than \$39 billion, just under 10 percent of all U.S. merchandise exports in 1990. The aerospace trade balance topped the prior record by 23 percent.

As regards the industry's future outlook, AIA estimates — on the basis of the Administration's force reduction program outlined by the Secretary of Defense — that DoD aerospace sales will drop by 1995 to roughly 25 percent below the 1990 level in real terms.

That is a very large reduction and one that will pose a serious problem for those companies most heavily committed to defense work. The picture is less grim for the industry as a whole, because it is expected that much of the business lost to defense downsizing will be offset by gains in other areas.

In the weeks preceding publication of this volume, there have been a num-

ber of calls for defense cuts below the levels envisioned by the Administration plan. At the moment of writing, however, there has been no concerted action toward drastic cuts below the appropriation levels planned by the Administration.

To adjust to the changing environment, the aerospace industry is energetically pursuing new efficiencies in every aspect of its operation. So there is a bright side to the outlook: the industry may emerge from this decade of transition in better financial, technological and competitive strength than it enjoys today.

A handwritten signature in black ink, appearing to read "Don Fuqua". The signature is stylized and includes a long horizontal line extending to the right.

President

Aerospace Industries Association

91-92

Aerospace Summary

The U.S. aerospace industry recorded an all-time sales peak in 1990 in both current and constant dollars, according to data compiled by the Aerospace Industries Association (AIA). In current dollar terms, the record volume was compounded of increases in all sales categories.

Separately-reported data from the Bureau of the Census similarly showed peaks in current/constant dollar overall sales, and current dollar gains in most sales categories.

The principal factor in the industry's record performance was another big increase in non-military sales — in particular, sales of commercial transport aircraft. An additional factor was an upward fluctuation in sales to the Department of Defense, which had been on a declining curve since 1987.

Here is the breakdown of the industry's performance in 1990:

Sales

In current dollars, overall sales amounted to \$134.2 billion; a 14 percent increase over 1989's \$117.6 billion. Aerospace sales to the Department of Defense, after two years of decline, rebounded to \$60.6 billion, well over half of total aerospace products and services sales and up 3.6 percent over the prior year's \$58.5 billion.

In a breakdown by product group, aircraft sales predominated, as is customarily the case. Aircraft sales totaled \$70.8 billion, 16 percent above the record \$61 billion reported in the previous year.

Military aircraft sales amounted to \$39.9 billion, up slightly from 1989 in current dollars but actually a decline when

adjusted for inflation. Civil aircraft sales (including engines and parts) totaled \$30.9 billion, up almost 40 percent over the previous record (1989) of \$22.1 billion.

The big gain moved civil aircraft into second place among product categories, after having trailed space sales for seven prior years. Space sales nonetheless showed a strong gain, up 12 percent from \$25.8 billion in 1989 to \$28.9 billion in 1990.

Sales of missile systems, at \$12.1 billion, increased from 1989's \$11.2 billion. In the "Related products and services" category, sales amounted to \$22.4 billion, which compares with \$19.6 billion in 1989.

For 1990, aerospace industry sales represented 2.5 percent of the Gross National Product and 4.6 percent of total sales by all U.S. manufacturing industries. The comparable figures for 1989 were 2.3 percent and 4.1 percent.

Earnings

The industry recorded a net profit after taxes of \$4.5 billion, compared with \$3.9 billion in 1989. Expressed as a percentage of sales, the 1990 profit (3.4 percent) approximated that of 1989 (3.3 percent).

Aerospace earnings remained well below the average for all U.S. manufacturing industries in terms of sales and assets. The 3.4 percent realized on aerospace sales compare with 4.0 percent for all manufacturing corporations. As a percentage of assets, the aerospace profit amounted to 3.4 percent; the all-manufacturing figure was 4.3 percent. In terms of equity, aerospace earnings amounted to 11.5 percent, compared with the all-industry average of 10.7 percent.

Orders and Backlog

After surging to an all-time high of \$173.6 billion in 1989, net new orders

received by aerospace companies dropped sharply to \$147.4 billion according to the Census Bureau. Most of the decline was due to a plunge in orders from the Department of Defense, which fell to the lowest level since 1981.

Orders from the U.S. Government totaled \$56.8 billion, down from \$80.6 billion in 1989. Census reported declining orders in all product categories.

Despite those declines, the industry's backlog rose appreciably, from \$252.4 billion at the end of 1989 to \$264.2 billion as of December 31, 1990. This was due to the fact that non-government backlog experienced a large increase (more than \$27 billion) that more than offset a sharp decline in the backlog of government business (down more than \$15 billion). The major component of the non-government backlog, and also the major area of gain, was civil aircraft, engines and parts; the backlog increase was more than \$25 billion. These data once again underline the indicated shift in the industry product mix during the 1990s, in which commercial product manufacture is expected to account for an ever-increasing percentage of total sales.

Civil Aircraft Production

Sales of civil aircraft declined in numerical terms (from 2,448 in 1989 to 2,268 in 1990) but increased dramatically in dollar value (\$24.5 billion in 1990 compared with \$17.1 billion in 1989).

In terms of dollar value, sales of transport aircraft accounted for more than 90 percent of the civil aircraft total. The industry shipped 521 commercial transports valued at \$22.2 billion, which compares with 398 units worth \$15 billion in the previous year.

Shipments of general aviation planes declined by 391 units but total dollar value of the 1,144 aircraft delivered came to more than \$2 billion, up

from \$1.8 billion in 1989.

Sales of civil helicopters, at \$254 million, were up from \$251 million.

Military Aircraft Production

The industry produced 1,062 military aircraft in 1990, including 674 planes for the U.S. military services and 388 exported under Foreign Military Sales (FMS) programs or through direct sales by U.S. manufacturers to foreign governments. The comparable figures for 1989 were 1,261 total, 614 for U.S. services, 647 shipped abroad.

Acceptances by U.S. military agencies totaled 773 aircraft (the 674 for the U.S. military plus 99 FMS aircraft). The bulk of the acceptances was in fighter/attack aircraft (451 units) and helicopters (260 units). Total flyaway value of the 773 acceptances was \$13.2 billion (up from \$12 billion in 1989).

Foreign Trade

Once again the aerospace industry set new records for export volume and trade balance. Aerospace exports increased by almost 22 percent to \$39.1 billion; the aerospace trade balance — \$27.3 billion — represented a 24 percent increase over the prior record (\$22.1 billion in 1989). Aerospace exports amounted to 9.9 percent (in dollar value) of all U.S. merchandise exports in 1990.

Aerospace imports continued to climb; they set a seventh consecutive record at \$11.8 billion, up from \$10

billion in 1989.

Civil products accounted for more than 80 percent of the total U.S. aerospace export volume. Civil aerospace exports totaled \$31.5 billion in 1990, up from \$25.6 billion in the previous year. Military exports reached an all-time high of \$7.6 billion, which compares with \$6.5 billion in the previous year.

Space Systems

Sales of space systems have increased in both current and constant dollars in every year since 1977. With sales of \$28.9 billion in 1990, the industry recorded exceptional growth — 12 percent above the 1989 level of \$25.8 billion. But despite the increase, space slipped from second to third place among industry product groupings.

The pace of new orders for space systems slowed significantly in 1990 according to Bureau of the Census data, which exclude propulsion systems. Net new orders totaled \$9.6 billion, down 18 percent from the record 1989 level of \$11.7 billion. Nonetheless, the year-end space backlog, at \$13.3 billion (again excluding propulsion) remained relatively constant, backlog at year-end 1989 was \$13.4 billion.

The prospect of continuing high levels of space sales was evidenced in data on government investment in space. Federal space outlays for FY 1990 amounted to \$28.1 billion, up from \$25.1

billion in FY 1989. For FY 1991, the estimate was \$29.8 billion.

Missile Systems

Since 1982, sales of missile systems and parts have remained relatively constant in the \$10-12 billion a year range, according to AIA data. In 1990, the industry recorded an eight percent gain to \$12.1 billion.

Bureau of the Census data, not directly comparable because Census excludes propulsion units, showed a slight decline in missile and parts sales, from \$9.3 billion in 1989 to \$9.1 billion in 1990. Separately, Census data covering propulsion systems for missiles and space launch vehicles shows 1990 sales of \$3.1 billion, which compares with \$3.6 billion in 1989.

Net new orders for missile systems and parts came to \$7.9 billion in 1990 (excluding propulsion); this compares with \$9 billion in the previous year. Orders for missile/space propulsion systems amounted to \$3.2 billion in 1990, far below 1989's \$6.1 billion. Census showed the year-end backlog for missiles and parts at \$12.8 billion, down from \$14 billion at year-end 1989; the backlog for missile/space propulsion systems was \$6.5 billion, up from \$6.4 billion.

Research and Development

According to the National Science Foundation, U.S. R&D funding from all sources in 1991 is expected to total \$151.6 billion, up four percent from the 1990 level of \$145.5 billion. Of the total, U.S. industry would spend \$78 billion, or 51 percent of the total, and would perform 72 percent of the R&D.

R&D performed by the aerospace industry in 1990 including both federal and industry funding was estimated by Battelle Memorial Institute at \$24.3 billion. For 1991, the industry-funded portion was expected to drop by \$117 million to \$6.8 billion.

Government estimates put federal outlays for R&D at \$63.4 billion in FY 1991, compared with \$62 billion in FY 1990. For FY 1992, the estimate is \$68.1 billion.

The Department of Defense continues to be the largest — by far — conductor of government-funded R&D. DoD outlays for FY 1991 were estimated at \$36.1 billion; the estimate for FY 1992 is \$38.4 billion. NASA outlays were estimated at \$7 billion in FY 1991 and \$7.8 billion in FY 1992.

Employment

Due primarily to declining defense activity, industry employment fell by 19,000 in 1990 on an annual average basis. Annual average employment dropped from 1,314,000 in 1989 to 1,295,000 in 1990, marking the first reduction since 1983.

Aerospace employment accounted for 6.8 percent of the total employment in all U.S. manufacturing industries, as was the case in 1989.

The aerospace payroll for 1990 amounted to \$35.6 billion, up 3.6 percent over the \$34.4 billion paid in 1989. For 1990, the aerospace payroll represented 6.5 percent of total payroll outlays by all U.S. manufacturing firms.

Source: Aerospace Industries Association.

NOTE: See Glossary for explanation of "Aerospace Industry," "Aerospace Sales," and "Related Products and Services." A comprehensive revision of the AIA aerospace industry sales series for 1967-1984 was completed in 1985 in order to incorporate different data sources and estimating procedures selected to better reflect the evolving composition of the aerospace industry.

^a Based on revised aerospace composite deflator.

^r Revised.

a Outlays for aircraft and missile procurement. Does not include RDT&E, which DOD has not reported by product group since 1977, and which for comparability, has been subtracted from data previously reported in this table for earlier years.

b Includes Research & Development and Research & Program Management, and effective with 1984 data, Space Flight, Control, and Data Communications; excludes Construction of Facilities.

c 1978 and subsequent years revised by AIA from previously published data to include Navy Weapons Procurement in Missiles Procurement. Beginning 1978, DOD combined Navy Missile Procurement with torpedoes and other related products into Navy Weapons Procurement, of which missiles comprise approximately 80 percent.

^E Estimate. Latest year reflects Administration's budget proposal.

^r Revised.

91-92

Aircraft Production

In 1990, industry sales of aircraft, engines and parts not only set a new record but topped the prior record by an impressive 23 percent. Sales totaled \$66.3 billion, up from \$53.8 billion in the previous year.

The 1990 sales volume was compounded of increases in both the U.S. Government (military aircraft) and non-government (principally commercial aircraft) business segments. Sales to the U.S. Government came to \$24.6 billion, an anomalous increase of \$3.3 billion over 1989 (military aircraft sales had been expected to decline slightly due to budget reductions). Despite the gain, military sales remained far below the level of non-government sales, which reached an all-time high of \$41.7 billion with a \$9.2 billion gain over 1989, the largest single-year increase in history.

The industry delivered 2,268 civil aircraft and 1,062 military aircraft for a total of 3,330; the latter figure compares with 3,709 in 1989.

Civil aircraft production, including domestic and export shipments, consisted of 521 commercial transports (up from 398), 603 helicopters (up from 515), and 1,144 general aviation aircraft (down from 1,535). Civil production was actually down by 180 units, but the total dollar value (\$24.5 billion) represented an increase of nearly 43 percent over 1989 (\$17.1 billion). Sales of transport aircraft (\$22.2 billion) accounted for more than 90 percent of the 1990 total.

Orders for aircraft, engines and parts dropped significantly in 1990, down to \$81.8 billion from 1989's \$96.6 billion. U.S. Government orders fell by more than \$10 billion (\$15 billion in 1990 compared with \$25.4 billion in 1989). There was also, for the first time since 1982, a decline in non-government

orders, from \$71.2 billion in 1989 to \$66.8 billion in 1990. The latter decline was not indicative of a new trend; the volume failed to match the tremendous flood of orders experienced in 1989 but it nonetheless represented the second highest level of new business in history.

The backlog of orders reached its highest-ever peak despite a significant drop in the U.S. Government backlog. The overall backlog, as of December 31, 1990, was \$174 billion, up from \$159.2 billion in 1989. The total included \$147.8 billion in non-government orders (up \$25 billion) and \$26.2 billion in government orders (down \$10 billion).

Among other 1990 aircraft production highlights:

- Commercial transport sales increased sharply for the sixth straight year, to \$22.2 billion from 1989's \$15.1 billion. The year-end backlog for commercial transports was \$112.3 billion, compared with \$89.1 billion at the end of the previous year. Foreign orders amounted to \$71.2 billion or 63 percent of the total backlog.
- Sales of civil helicopters, at \$254 million, were up slightly over 1989's \$251 million.
- Although shipments of general aviation aircraft declined by 391 units, the total dollar value increased to more than \$2 billion from 1989's \$1.8 billion.

- The 1,062 military aircraft produced included 674 delivered to U.S. military agencies and 388 exported under Foreign Military Sales (FMS) programs or direct sales by U.S. manufacturers to foreign governments. The comparable figures for 1989 were 614 delivered to U.S. agencies and 647 exported.

**SPECIFICATIONS OF U.S. MILITARY AIRCRAFT
ON ORDER OR IN PRODUCTION AS OF 1990**

Primary Mission, DOD Designation, & Popular Name	Manufacturer	U.S. Military Service	Crew	Empty Weight (000's lbs)	Engines	Performance Typical for Primary Mission	Remarks
ATTACK							
A-6E Intruder	Grumman	USN/USMC	2	27	2xP&W J52	Mach 0.8 at sea level	Also EA-6A/B & KA-6D
AV-8B Harrier 2	MDC/BAe	USMC	1	13	1xRR F402	Mach 0.91	Graphite/epoxy super-critical wing
BOMBERS							
B-2 Stealth Bomber	Northrop	USAF	2-3	-	4xGE F118	-	Radar eluding tactical bomber
ELECTRONIC WARFARE							
EA-6B Prowler	Grumman	USN/USMC	4	33	2xP&W J52	493 n.m. standoff radius	Tactical jamming system
FIGHTERS							
F-14A Tomcat	Grumman	USN	2	40	2xP&W TF30	Mach 2.3 class	Missile, gun fleet defense
F14A + Super Tomcat	Grumman	USN	2	42	2xGE F110	Mach 2.3 class	F-14A with upgraded engines and radar
F14Q	Grumman	USN	2	42	2xGE F110	Mach 2.3 class	F14A + with improved avionics and infrared track and search system
F-15C/D Eagle	MDC	USAF	1-2	31	2xP&W F100	Mach 2.5 class	Air superiority, defense, guns, missiles; 15D = 2 seat trainer
F-15D Eagle	MDC	USAF	2	32	2xP&W F100	Mach 2.5 class	Dual role fighter/long range interdiction
F-16 A/B Fighting Falcon	GD	USAF	1-2	15	1xP&W F100	Mach 2+ class	Multirole fighter; fully fly-by-wire; missiles, guns.
F-16 C/D Fighting Falcon	GD	USAF	1-2	16	1xP&W F100/ 1xGE F110	Mach 2+ class	Provisions for AMRAAM, LANTIRN, and new EW Nav. Comm. Systems
F/A-18 Hornet	MDC/Northrop	USN/USMC	1	23	2xGE F404	Mach 1.7 class	Missiles, guns; also export
COMMAND/CONTROL AND PATROL							
E-2C Hawkeye	Grumman	USN	5	38	2xAll T56	6 hr. mission duration	AEW command & control; passive detection
E-6A	Boeing	USN	18	167	4xCFM56	Long endurance	AEW command & control
CARGO-TRANSPORT							
C/HC-130 Hercules	Lockheed	USAF/USN	4	74-78	4xAll T56	363 mph; 2,038 n.m.	92-128 troops or 39-43,000 lbs
C-5B Galaxy	Lockheed	USAF	6	363	4xGE TF39	Cruise 563 mph; 3,000 n.m. range	Global strategic logistics; 261,000 lb. cargo capacity
C-17A	MDC	USAF	3	270	4xP&W F117	Mach 0.77; 3,000 n.m.	102 troops or 172,000 lbs.
C-26	Fairchild	ANG	2	10	2xGA TPE-331	275 mph; 700 n.m.	8-place; pass. or cargo
TRAINING							
T-45A Goshawk	MDC/BAe	USN	2	9	1xRR F405	Mach 0.85 at 35,000 ft.	Next generation trainer
T-1A	Beech	USAF	2	11	2xP&W AJT-15D	460 kt at 35 k ft.	Tanker/Transport Trainer
HELICOPTERS							
AH-1W Super Cobra	Bell-Textron	USN	2	10	2xGE T700	Max 218 mph; 395 mi.	TOW, hellfire, sidewinder
AH-64 Apache	MDC	Army	2	12	2xGE T700	Max 197 mph; 445 mi.	Attack helicopter
CH/MH-53E	Sikorsky	USN	3-8	33-36	3xGE T64	Max 196 mph; 710 mi.	55 passengers, aux. tanks/ minesweeping
HH-60H	Sikorsky	USN	4-12	14	2xGE T700	Max 135 mph; 500 mi.	Strike and rescue
SH-2F Seasprite	Kaman	USN	3	14	2xGE T58	Max 160 mph; 430 mi.	LAMPS Mk.1 helicopter
SH-60B Seahawk	Sikorsky	USN	3	15	2xGE T700	Max 171 mph; 640 mi.	ASW
SH-60F	Sikorsky	USN	4	14	2xGE T700	Max 177 mph; 789 mi.	ASW
UH-60A Black Hawk	Sikorsky	Army/USAF	3	11	2xGE T700	Max 184 mph; 373 mi.	UTTAS

91-92

Missile Programs

Industry sales of missile systems declined slightly in 1990, as they had in each of the preceding two years. According to Bureau of the Census reports, sales of missile systems and parts (excluding propulsion units) amounted to \$9.1 billion, down from \$9.3 billion in 1989.

Census separately reported sales of missile propulsion systems as part of a statistical grouping that also includes propulsion units for civil and military space vehicles. In 1990, total sales in that grouping came to \$3.1 billion, which compares with \$3.6 billion in 1989.

Net new orders for missile systems and parts totaled \$7.9 billion, down from \$9 billion in the previous year; the figures do not include propulsion units. Orders for missile/space propulsion systems amounted to \$3.2 billion, a very sharp drop from 1989's \$6.1 billion.

The year-end backlog for missile systems and parts was \$12.8 billion, down from \$14 billion at the end of the previous year. The backlog for propulsion units was \$6.5 billion, compared with \$6.4 billion at the end of 1989.

The Department of Defense (DoD) budget plan for FY 1992 contemplated procurement of missile systems valued at \$12.6 billion, down from \$14.2 billion in 1991. However, the FY 1992 figure will be further reduced by Congressional and Administration actions, not finalized at publication time, involving cancellation of some major R&D programs.

Nonetheless, the DoD plan offers an approximate guideline to the scope of programs and program priorities. Under the plan as submitted to Congress, Air Force outlays for missile procurement in FY 1992 would have totaled \$6.2 billion (down from \$7.3 billion in 1991); the Navy's \$4.3 billion

(down from \$4.4 billion) and the Army's \$2.2 billion (down from \$2.5 billion).

Missile programs in production or operational service during 1990/91 and funded under FY 1991 appropriations include:

Air Force

The AMRAAM (Advanced Medium Range Air-to-Air Missile), \$815 million; the Peacekeeper ICBM, \$535 million; the Advanced Cruise Missile, \$454 million; the HARM antiradiation weapon being procured by the Air Force for both USAF and Navy use, \$370 million; the AGM-130 air-to-surface weapon, \$38 million; the HAVE NAP Israeli-designed air-to-surface missile for standoff launch against hard targets, \$25.8 million; and the SRAM II supersonic air-to-surface missile, \$10 million.

Navy

The Trident II Fleet Ballistic Missile, \$1.5 billion; the Tomahawk ship-launched cruise missile, \$659 million; the Standard ship defense surface-to-air missile, \$608 million; the Harpoon antiship missile, \$241 million; the Penguin antiship missile, \$44 million; and the Maverick air-to-surface weapon, \$13 million.

Army

The Patriot long-range air defense missile, \$736 million; the Multiple Launch Rocket System, a mobile rocket battery,

\$463 million; the Stinger short-range antiaircraft weapon used by all services, \$252 million; the ATACMS (Army Tactical Missile System), \$187 million; the TOW 2 (Army / Marine Corps antitank weapon), \$185 million; the Laser Hellfire helicopter-launched antiarmor missile, \$148 million; the Avenger air defense missile, \$118 million; and the AAWS-M antiarmor missile, \$16 million.

NOTE: Detail may not add to totals because of rounding.

^a Revised by AIA from previously published data to include Navy Weapons Procurement in Total Missile Procurement. Beginning 1978, DOD combined Navy Missile Procurement with torpedoes and other related products into Navy Weapons Procurement. Missiles comprise approximately 80 percent of the value of this category.

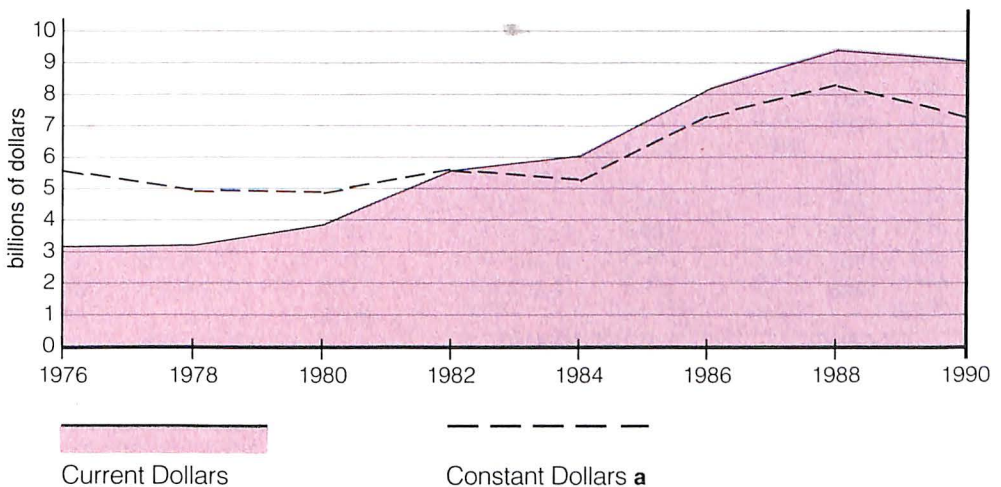

^E Estimate. Latest year reflects Administration's budget proposal.

91-92

Space Programs

In 1990, industry sales of space systems reached an all-time high in both current and constant dollar terms. According to data compiled by the Aerospace Industries Association, sales of civil and military space systems amounted to \$28.9 billion. That figure represents a gain of more than 12 percent over the \$25.8 billion recorded for the previous year. Despite the increase, space sales slipped from second to third place among industry product groupings (behind military aircraft and civil aircraft).

The Bureau of the Census reported a big drop in net new orders for space systems, which were down 17.8 percent from the 1989 all-time peak. Orders amounted to \$9.6 billion in 1990, Census said; the comparable figure for 1989 was \$11.7 billion.

The year-end 1990 space systems backlog (excluding propulsion) was \$13.3 billion, according to Census; the previous year's figure was \$13.4 billion.

Government investment in space programs continued on the upward trend in evidence since 1973. According to the NASA Aeronautics and Space Report of the President, federal outlays for FY 1990 amounted to \$28.1 billion. The estimate for FY 1991 (based on Administration budget proposals) was \$29.8 billion.

The Department of Defense (DoD) remained the principal space-engaged agency in terms of outlays, with \$15.4 billion in FY 1990. NASA was second with \$12.3 billion in space outlays, followed by the Department of Commerce (DoC), \$232 million, and the Department of Energy (DoE), \$79 million. Estimates for FY 1991 outlays were \$16.3 billion for

DoD, \$13.1 billion for NASA, \$223 million for DoC and \$106 million for DoE.

Budget authority data for DoD (USAF) and NASA provides information about the areas of greatest developmental and operational effort.

In FY 1991, the USAF's principal effort (in dollar terms) was the Strategic Defense Initiative, which was funded at \$2.9 billion for Research, Development, Test and Evaluation (RDT&E). Other major RDT&E programs were the Milstar advanced communications satellite, \$760 million; the Defense Support Program, \$274 million; the Medium Launch Vehicle, \$185 million; and space boosters, \$128 million.

The USAF's primary procurement program in FY 1991 was the Defense Support Program, funded at \$400 million. Other major procurements included the Medium Launch Vehicle, \$270 million; the Navstar Global Positioning System, \$223 million; space boosters, \$207 million and Milstar, \$194 million.

NASA funding is reported in four major categories. For FY 1991, Research and Development outlays amounted to \$5.7 billion; Space Flight, Control and Data Communications, \$5.2 billion; Research and Program Management, \$2.2 billion; and Construction of Facilities, \$363 million. A breakdown of the Research and Development cat-

egory showed \$1.9 billion for development of Space Station Freedom; \$2.4 billion for Space Science and Applications; \$603 million for space transport capability development; and \$86 million for commercial use of space.

- a Payloads, rather than launchings; some launches account for multiple spacecraft. Includes spacecraft from cooperating countries launched on U.S. launch vehicles.
- b The criterion of success is attainment of Earth orbit or Earth escape rather than judgement of mission success. "Escape" flights include all that were intended to go at least an altitude equal to the lunar distance from the Earth.
- c This Earth-escape failure did attain Earth orbit and therefore is included in the Earth-orbit success totals.
- r Revised.

91-92

Air Transportation

In 1990, the U.S. air carrier industry recorded an all-time high in operating revenues, yet wound up with the greatest operating loss in history as operating expenses outpaced revenue gains.

The loss amounted to \$1.9 billion, compared with an operating profit of \$1.8 billion in the preceding year. Revenues in 1990 totaled \$76 billion, up from \$69.2 billion in 1989. Expenses, however, increased by \$10.5 billion to \$77.9 billion.

The 16 percent jump in operating expenses was occasioned primarily by a sharp increase in fuel prices in the months following Iraq's invasion of Kuwait on August 2, 1990. In addition, there were continuing increases in normal operating costs, such as labor. Yield-reducing, fare-pricing practices and declining load factors also contributed to the industry's poor financial performance.

As is customary, domestic operations accounted for more than three-quarters of revenue. Domestic revenues totaled \$58 billion, but domestic operating expenses exceeded the revenue by more than \$1 billion.

In U.S. airline international service, revenues continued to increase dramatically, as they have since the mid-eighties. International revenues for 1990 amounted to \$18 billion; the operating loss was \$902 million.

Despite the recession, traffic (revenue ton miles) on U.S. airlines increased by 5.3 percent, compared with 3.1 percent in 1989. In 1990, the scheduled carriers flew 58.4 billion revenue ton miles, up from 55.5 billion in 1989. Passenger traffic amounted to 45.8 billion revenue ton miles, cargo traffic

for 12.6 billion; the comparable figures for the preceding year were 43.3 billion in passenger service and 12.2 billion in cargo haulage. The total revenue load factor dropped by a full percentage point, to 54.4 percent from 1989's 55.4 percent.

In domestic service, U.S. scheduled airlines boarded more than 423 million passengers, up from 416 million in 1989, and revenue passenger miles totaled more than 340 million, up from 330 million. The domestic service load factor was 60.4 percent, down from 62.3 percent in 1989.

ceeded revenues by \$2.5 billion. The result was a loss of 1.3 percent of revenue, which compared with a positive result of 4.4 percent in 1989.

According to Exxon International Company's annual survey, covering aircraft in service as of March 31, 1990, the world fleet of turbine engine aircraft in airline service grew by 1,137 units in 1989-90 (the survey excludes aircraft operated by the Soviet national airline Aeroflot and air taxi operators).

Exxon reported a total of 14,651 active aircraft (up from 13,514), including 9,426 turbojets (up from 8,587); 5,049

Growth was somewhat stronger in international traffic carried by U.S. scheduled airlines. Enplanements, at 41.8 million, topped the previous record of 37.4 million in 1989 by more than 12 percent. Revenue passenger miles amounted to 117.7 billion, compared with 102.7 billion in 1989. Passenger load factor reached a new record level of 69.1 percent.

Global airline revenues/expenses closely paralleled the U.S. airline experience. In operations by airline members of the International Civil Aviation Organization, total operating revenues came to \$198 billion, but expenses ex-

turboprops (up from 4,687); and 176 turbine-powered helicopters (down from 240).

Analysis discloses that the number of U.S.-manufactured turbine aircraft in world airline service increased (to 9,340 from 1989's 8,663) but the percentage continued to decline. The percentage has dropped every year since 1986, when 66.2 percent of the airplanes in the global turbine engine fleet were of American manufacture; in 1990 it was down to 63.7 percent. Among turbojet aircraft, the figure was 82.1 percent, among turboprops only 30.1 percent.

a Excludes temporary heliports, offshore heliports, and infrequently used helicopter landing sites.

91-92

Research and Development

Aerospace industry company-funded research and development in 1991 is expected to drop by more than \$117 million to a level of \$6.8 billion. Federal aerospace R&D funding estimates beyond 1990 are unavailable, preventing a total picture of aerospace R&D investment.

The estimate of company funding incorporates data from two separate surveys: Battelle Memorial Institute's 1990 publication, *Probable Levels of R&D Expenditures*, and the National Science Foundation (NSF) report, *Planned R&D Expenditures of Major U.S. Firms: 1990-91*. Battelle listed 1990 aerospace company outlays for R&D at \$6.9 billion; NSF estimated that aerospace companies would reduce 1991 funded R&D 1.7 percent below the 1990 figure.

In another report (*Annual Survey of Industrial Research and Development*), NSF estimated total U.S. funding for R&D from all sources at \$151.6 billion for 1991; this represents an increase of more than four percent above the 1990 level of \$145.5 billion. A breakdown of funding sources estimates that U.S. industry will spend \$78 billion, or more than 51 percent of the total. Federal government funding is expected to amount to \$66 billion. Colleges and universities will spend \$5 billion and nonprofit institutions will spend \$2.6 billion.

The NSF report estimates that industry will perform more than 71 percent of the 1991 R&D, using dollar value as the yardstick. Other performer's percentages (regardless of funding source) are: colleges and universities, 11.3 percent; federal government, 10.8 percent; federally-funded R&D centers, 3.2 percent; and nonprofit institutions, 3.1 percent.

The Office of Management and Budget (OMB) estimates fiscal year 1991 federal outlays for R&D at \$63.4 billion,

compared with \$62.1 billion in FY 1990; in inflation-adjusted constant dollars, however, the figure represents a decline of more than two percent. For FY 1992, OMB estimates outlays of \$68.1 billion, which would amount to a real-term increase.

A breakdown of the FY 1991 estimates shows—as usual—that the Department of Defense is by far the largest conductor of government-funded R&D. OMB estimates DoD FY 1991 outlays at \$36.1 billion, or 57 percent of the total. Among other agencies, NASA outlays are estimated at \$7 billion (11 percent) and the Department of Energy at \$5.8 billion (9 percent).

DoD outlays will continue to increase in FY 1992, according to OMB estimates, which list DoD at \$38.4 billion (up \$2.3 billion); NASA at \$7.8 billion (up \$793 million); the Department of Energy at \$6.3 billion (up \$463 million); and all other federal agencies at \$15.6 billion (up \$1.1 billion).

Within the Department of Defense, the Air Force continues to lead the other services in appropriations for Research, Development, Test and Evaluation

(RDT&E). For FY 1991, the USAF appropriations was \$11.7 billion (down from \$13.6 billion in FY 1990) and the estimate for FY 1992 is \$15.2 billion. The

Navy figures are \$8.3 billion in FY 1991 (down \$1.2 billion) and \$8.2 billion in FY 1992. Army appropriations for RDT&E were \$5.4 billion in FY 1991 (up from \$5.3 billion) and \$6.2 billion in FY 1992.

The Pacific region, perennial leader, again topped a geographical breakdown of FY 1990 prime contract awards for RDT&E. Pacific area firms won \$7.4 billion in prime contract awards, or 33.9 percent of the total.

The ranking and dollar value of contracts received by other regions was: Mountain, \$3.0 billion, 13.6 percent; South Atlantic, \$2.9 billion, 13.2 percent; New England, \$2.5 billion, 11.3 percent; Middle Atlantic, \$2.1 billion, 9.8 percent; West North Central \$1.4 billion, 6.6 percent; East North Central, \$1.2 billion, 5.5 percent; West South Central, \$698 million, 3.2 percent; and East South Central, \$627 million, 2.9 percent.

91-92

Foreign Trade

For the sixth consecutive year, the U.S. aerospace industry set a new record in 1990 for export volume. It was also the sixth consecutive year of rising trade surpluses and the fourth year in a row in which aerospace set a new trade balance record. Offsetting to a considerable degree U.S. trade deficits in other areas, the achievement underlined once again the importance of high value, high technology exports to the U.S. economy.

In a year in which the nation as a whole experienced a merchandise trade deficit of more than \$101 billion, U.S. aerospace exports climbed to \$39.1 billion, a gain of almost 22 percent above the previous record, 1989's \$32.1 billion. Aerospace exports amounted to 9.9 percent of all U.S. merchandise exports in 1990.

Aerospace imports continued the steady climb in evidence since 1983 and set a seventh consecutive record at \$11.8 billion, up from \$10 billion in 1989. Imports, however, have increased at a lower rate (18 percent) than exports.

The record aerospace trade balance was \$27.3 billion, up nearly 24 percent above the prior record (\$22.1 billion in 1989).

Civil products accounted for more than 80 percent of the total U.S. aerospace export volume; the 1990 figure of \$31.5 billion compares with \$25.6 billion in the previous year. More than half of the 1990 volume of civil exports was in deliveries of commercial transport aircraft with a total dollar value of \$16.7 billion. Military exports reached an all-time high of \$7.6 billion, up from \$6.5 billion in 1989.

A breakdown of civil exports shows sales of complete aircraft at \$18.1 billion (up from \$14 billion in 1989); aircraft

and engine parts at \$11.3 billion (up from \$10 billion); and aircraft engines at \$1.8 billion (down from \$1.9 billion).

In addition to the \$16.7 billion in commercial transport exports, civil aerospace exports consisted of \$555 million

export gain over the previous year was in sales of complete aircraft, up \$726 million over 1989 but still well below the levels of 1987-88. Exports of guided missiles, rockets, and parts rose 24 percent or \$253 million.

in general aviation sales (up from \$413 million); \$712 million in used aircraft (up from \$533 million); \$161 million in helicopters (up from \$156 million); and \$360 million (up from \$217 million) in a category designated "Other, including spacecraft".

The military export total of \$7.6 billion included \$1.8 billion in complete aircraft, \$4.3 billion in aircraft and engine parts, \$1.3 billion in guided missiles, rockets and parts; and \$203 million in aircraft engines. The bulk of the military

Civil products totaling \$8.3 billion accounted for 70 percent of all aerospace imports. The breakdown: complete aircraft, \$2.8 billion; aircraft and engine parts, \$4.2 billion; aircraft engines, \$1.2 billion. Military imports, up 26 percent to \$3.6 billion, included \$2.3 billion in aircraft and engine parts, and \$1.2 billion in aircraft engines.

The principal customers for U.S. aerospace exports in 1990 were the United Kingdom, which bought products valued at \$5 billion; Japan, \$4.2 billion, France, \$3.3 billion; Germany, \$2.8 billion; Canada, \$2.2 billion; and Australia, \$1.8 billion. Other major customers included The Netherlands, \$1.6 billion; Spain, \$1.2 billion; and South Korea, \$1.1 billion.

Three countries accounted for more than two-thirds of all aerospace imports into the U.S.: France, \$2.8 billion; the United Kingdom, \$2.7 billion; and Canada, \$2.5 billion.

Source: Export-Import Bank of the United States.

^a Includes complete aircraft, engines, parts, and retrofits.

^b Includes business aircraft, general aviation aircraft, helicopters, and related goods and services.

^c Loans are commitments for financing by the Export-Import Bank to foreign buyers of U.S. equipment and services, including Direct Credits, loans authorized under the Cooperative Financing Facility (CFF), (until the termination of the CFF program in 1981), and Discount Loans, which are made by the Export-Import Bank to commercial banks and which subsequently may be guaranteed by the Export-Import Bank, in which case the value of the loans is also included with Guarantees.

^d Guarantees by the Export-Import Bank provide assurances of repayment of principal and interest on loans made by private lending institutions, such as commercial banks, for major export transactions. Excludes insurance.

a Amount of loan as percent of export value.

b Number of payments and frequency (S = semi-annual).

91-92

Employment

The aerospace industry's labor force suffered a net loss of 19,000 jobs in 1990 as average annual employment fell from 1989's 1,314,000 to 1,295,000. The decrease was due to large-scale layoffs in defense production activity, which were only partially offset by personnel gains in manufacture of commercial transports and space systems.

The 1990 employment figure represented 6.8 percent of the total employment in all U.S. manufacturing industries, the same percentage as in the previous year. It also represented 11.7 percent of the total employed by U.S. companies producing durable goods; the comparable figure for 1989 was 11.5 percent.

In line with the traditional pattern of employment distribution in the industry, more than half (54.5 percent) of the labor force was engaged in manufacture of aircraft, engines and parts. Annual average employment in that category was 706,000, down from 711,300 in the previous year.

Employment averaged 186,000 in the industry segment producing missiles and space vehicles. This segment absorbed a cut of 8,000 personnel, from an average level of 194,000 in 1989. Average employment in all other aerospace-related activities dipped from 1989's 409,000 to 403,000 in 1990.

The number of production workers in the industry declined by only slightly more than one percent, from 434,000 in 1989 to 429,000 in 1990. In aircraft, engines and parts manufacture, production workers numbered 341,700, roughly 80 percent of the total; the number was 57,000 in missiles/

space and 30,000 in the "other" aerospace-related category.

The annual payroll, at \$35.6 billion, was up 3.6 percent over 1989's \$34.4 billion; both figures include lump sum payments made by many aerospace firms in lieu of general wage or cost of living increases. The aerospace payroll represented 6.5 percent of combined payroll outlays by all U.S. manufacturing industries; the comparable figure for 1989 was 6.4 percent.

The average weekly earnings in the industry — again including lump sum payments — came to \$637, up from \$605 in 1989. Average hourly earnings amounted to \$15.04, up from \$14.37.

The average work week was 42.3 hours, compared with 42.1 hours in 1989.

In a year-end geographic breakdown of aerospace employment, the Pacific region dominated as usual but with a sharply reduced percentage of the total. Pacific led the eight geographic regions with 39.4 percent. The New England region remained second in 1990 with 13.6 percent. Next, in order, were the West North Central (9.1 percent),

South Central (9 percent), South Atlantic (8.6 percent), Middle Atlantic (8.2 percent), Mountain (6.4 percent), and East North Central (5.7 percent) regions.

The Pacific region also dominated in all product group breakdowns of aerospace employment. In civil aircraft manufacture, employment at companies in the Pacific region constituted 53.2 percent of the total. New England was a distant second at 16.4 percent; and the West North Central region was third at 9 percent.

In military aircraft production, the Pacific region led with 23.9 percent of the work force, followed by the South Central (19.6 percent) and West North Central (14.3 percent) regions. Regional breakdowns for the work force engaged in missile manufacture were: Pacific (36.8 percent), New England and Middle Atlantic combined (29.5 percent), and South Atlantic 15.3 percent. The Pacific region again led in space-related employment with 53.5 percent of the work force, followed by the Mountain (17.3 percent), and New England/Middle Atlantic (11.9 percent) regions.

Source: Bureau of Economic Analysis, "Survey of Current Business" (Monthly) and Aerospace Industries Association estimates based on Bureau of Labor Statistics, "Employment and Earnings" (Monthly).

^a See Glossary for explanation of "Payroll, All Manufacturing."

^b Based on combined annual average employment and average weekly earnings for SICs 372 and 376.

^c The Bureau of Labor Statistics revised its previously published estimates of employment and earnings for the period 1979-1989 to be consistent with their latest benchmarks.

^d Many aerospace manufacturers have included lump-sum payments in labor settlements since late 1983 in lieu of general wage increases and/or cost of living adjustments. These payments are reported by BLS in separate wage series for SICs 3271 & 3761 and are included by AIA in the totals for production workers and all aerospace.

1989 ^c	992	439	198	68	287
1990 ^p	946	421	189	65	271
1991 ^E	919	405	188	63	263

Source: Aerospace Industries Association, company reports and Bureau of Labor Statistics, "Employment and Earnings" (Monthly).

NOTE: Employment estimates have been revised for 1982 and after to reflect recently released March 1988 benchmarks. Consequently, figures for years prior to 1982 are not directly comparable.

a Totals for employment by occupational classification reflect only establishments in SICs 372, 376, 3662, 381, and 382. As a result, they do not match the totals for aerospace employment by product group which include other industries with employment related to aerospace.

b End-of-year figures often differ from annual averages appearing in other tables.

c Industry strike during this period.

E Estimate.

p Preliminary.

GEOGRAPHIC DISTRIBUTION OF AEROSPACE EMPLOYMENT^a BY OCCUPATIONAL CLASSIFICATION AND PRODUCT GROUP

As of December 1990

PERCENT DISTRIBUTION BY OCCUPATION

Region	TOTAL	Production Workers	Scientists & Engineers	Technicians	All Others
TOTAL	100.0%	100.0%	100.0%	100.0%	100.0%
New England	13.6%	17.4%	9.2%	10.6%	13.1%

91-92

Finance

Aerospace industry profits in 1990 rebounded from the sharp drop experienced in 1989 but remained below the levels of the preceding two years (1987-88). The 1990 net profit was \$4.5 billion, up from \$3.9 billion in 1989.

The gain resulted from a significant increase in overall sales, principally sales of commercial transports and space systems. The aerospace profit was achieved on 1990 sales of \$133.6 billion, which represents an increase of almost 13 percent over 1989 sales of \$118.3 billion.

Expressed as a percentage of sales, the 1990 profit amounted to 3.4 percent, up slightly from 1989's 3.3 percent. The aerospace figure, however, remained below the average for all U.S. manufacturing corporations, which in 1990 was 4 percent.

As a percentage of assets, the aerospace profit was also 3.4 percent (up from 3.3 percent) and as a percentage of equity it came to 11.5 percent (up from 10.7 percent). The comparable figures for all-manufacturing industries were 4.3 percent and 10.7 percent.

At \$4 billion in current dollars, the industry's outlays for new plant and equipment fell below 1989's all-time record figure of \$4.2 billion, but they were still higher than any other year in history. For 1991, the Bureau of the Census estimated a decline to \$3.9 billion.

The aerospace industry's balance sheet, as reported by the Bureau of the Census, showed an increase in net working capital from \$12.6 billion in 1989 to \$14.3 billion in 1990. Total assets amounted to \$131.8 billion, up from \$121.9 billion in 1989.

With contracts totaling \$8.2 billion in FY 1990, McDonnell Douglas Corporation was once again the leading Department of Defense contractor in terms of awarded contract dollar value; it was the company's fourth straight year at the top of the list. In second place was General Dynamics Corporation with \$6.3 billion, followed by General Electric Company (\$5.6 billion), General Motors Corporation (\$4.1 billion), and Raytheon Company (\$4.1 billion).

Rounding out DoD's top 10 contractors were Lockheed Corporation (\$3.6 billion), Martin Marietta Corporation (\$3.5

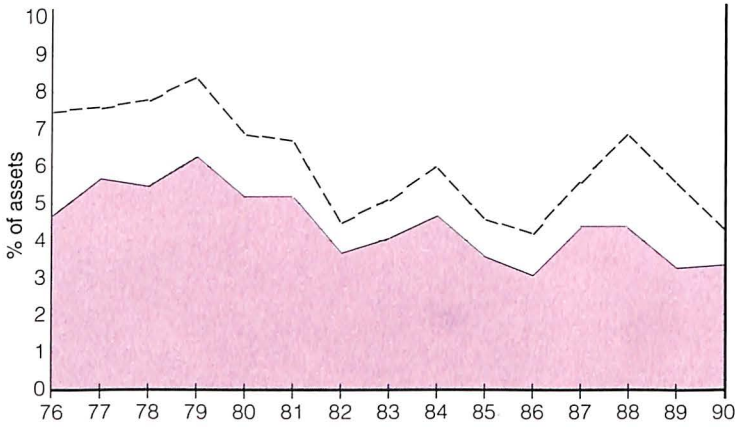

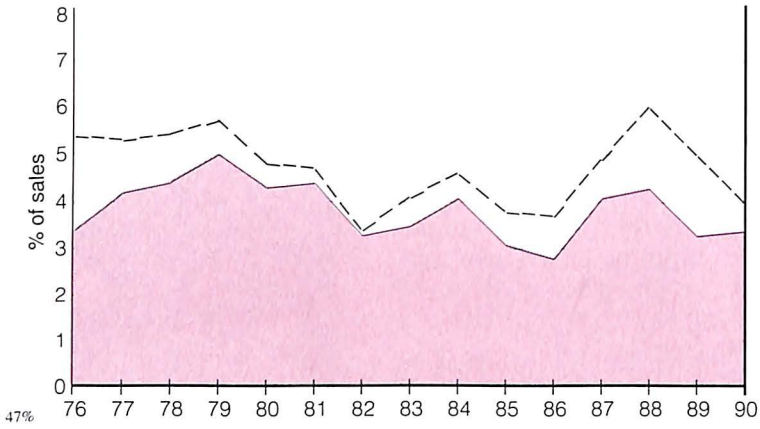

billion), United Technologies Corporation (\$2.9 billion), Grumman Corporation (\$2.7 billion) and Tenneco Inc. (\$2.4 billion). All but Tenneco placed in the top 10 in 1989; Tenneco replaced The Boeing Company, which slipped to 11th place.

Perennial leader Rockwell International Corporation once again headed the list of NASA's top contractors, with FY 1990 awards totaling \$1.7 billion. McDonnell Douglas (\$851 million) was second, followed by Lockheed Space Operations Company (\$583 million), Martin Marietta (\$507 million) and Thiokol

Corporation (\$498 million).

The rest of NASA's top 10 included General Electric Company (\$402 million), The Boeing Company (\$399 million), Rockwell Space Operations Inc. (\$309 million), Lockheed Missiles and Space Company (\$294 million), and TRW Inc. (\$241 million). In comparison with FY 1989, the latter two companies are new to the top 10 list; they replaced Lockheed Engineering & Science Company (11th in 1990) and Ford Aerospace Corporation (15th).

NOTE: Detail may not add to totals because of rounding.

a Includes Alaska and Hawaii.

r Revised.

91-92

Glossary

Aeronautics:

the science that treats of the operation of aircraft, also, the art or science of operating aircraft.

AIA:

Aerospace Industries Association of America, Inc., formerly Aircraft Industries Association.

Aerospace Industry:

the industry engaged in research, development and manufacture of aerospace systems, including manned and unmanned aircraft; missiles, space launch vehicles, and spacecraft; propulsion, guidance and control units for all of the foregoing; and a variety of airborne and ground based equipment essential to the test, operation, and maintenance of flight vehicles.

Aerospace Employment:

annual average calculated as one-twelfth of sum of monthly estimates of total number of persons employed during a designated pay period by the aircraft and missile and space industries (SIC 372 and 376) plus estimated aerospace-related employment in the communications equipment (SIC 3662) and instruments (SIC 381 and 382) industries and in certain other industries (SIC 28, 35, 73, 89, etc.).

Aerospace Payroll:

estimated on the basis of average weekly earnings for a given calendar year for production workers plus an es-

timated annual salary for other employees.

Aerospace Sales:

the AIA estimate of aerospace industry sales, developed by summing DOD expenditures for aircraft, missiles, and space-related procurement and RDT&E; NASA expenditures for research and development, and space flight control and data communications; outlays for space activities by other U.S. Government departments and agencies; commercial sales of space-related products; net domestic and export sales of civil aircraft, engines, and parts; FMS and commercial exports of military aircraft, missiles, propulsion, and related parts; and sales of related products and services, including electronics, software, and ground support equipment, plus sales of non-aerospace products which are produced in aerospace-manufacturing establishments and which use technology, processes, and materials derived from the aerospace industry. See also *Related Products and Services*.

Air Carriers:

the commercial system of air transportation, consisting of domestic and international scheduled and charter service.

Aircraft:

all airborne vehicles supported either by buoyancy or by dynamic action.

Used in this volume in a restricted sense to mean an airplane—any winged aircraft, including helicopters but excluding gliders and guided missiles.

Aircraft Agreement (Agreement on Trade in Civil Aircraft):

negotiated in the Tokyo Round of the Multilateral Trade Negotiations, and implemented January 1, 1980, providing for elimination of tariff and non-tariff trade barriers in the civil aircraft sector.

Aircraft Industry:

the industry primarily engaged in the manufacture of aircraft, aircraft engines and parts, aircraft propellers and parts, and aircraft parts and auxiliary equipment. A sector of the *Aerospace Industry*.

Airframe:

the structural components of an airplane, such as fuselage, empennage, wings, landing gear, and engine mounts, but excluding such items as engines, accessories, electronics and other parts that may be replaced from time to time.

Airlines:

see *Air Carriers*.

Appropriation (Federal Budget):

an act of Congress authorizing an agency to incur obligations and make payments out of funds held by the Department of the Treasury.

Assets, Net:

the sum of all recorded assets after reducing such amount by allowance of reserve for bad debts, depreciation and amortization, but before deducting any liabilities, mortgages or other indebtedness.

Astronautics:

the art and science of designing, building and operating manned or unmanned space objects.

Average Weekly Hours:

average hours for which pay was received; different from standard or scheduled hours.

Avionics:

Communications, navigation, flight controls, and displays.

Backlog:

the sales value of orders accepted (supported by legal documents) that have not yet passed through the sales account.

Budget Authority:

authority provided by the Congress; mainly in the form of *Appropriations*, which allows Federal agencies to incur obligations to spend or lend money.

Bureau of the Census:

an agency of the Department of Commerce.

Bureau of Economic Analysis (BEA):

an agency of the Department of Commerce.

Bureau of Labor Statistics (BLS):

an agency of the Department of Labor.

Constant Dollars:

see *Deflator*.

Deflator:

index used to convert a price level to one comparable with the price level at a different time, offsetting the effect of inflation. The base period, which equals 100, is usually specified as either a given fiscal or calendar year. *Constant Dollars* are calculated by dividing current ('then-year') dollars by appropriate price deflator, and multiplying by 100.

Depreciation:

the general conversion of the depreciable cost of a fixed asset into expense, spread over its remaining life. There are a number of methods, all based on a periodic charge to an expense account and a corresponding credit to a reserve account.

Development:

the process or activity of working out a basic design, idea or piece of equipment. See also *R&D*.

DOD:

Department of Defense.

DOE:

Department of Energy.

DOT:

Department of Transportation.

Durable Goods Industry:

comprised of major manufacturing industry groups with SIC Codes 24, 25, and 32-39. All major manufacturing industry groups in SIC Codes 20-23 and 26-31 are considered nondurable goods manufacturing industry groups.

Earnings:

the actual return to the worker for a stated period of time. Irregular bonuses, retroactive items, payments of various welfare benefits, and payroll taxes paid by employers are excluded.

Average Hourly Earnings: on a "gross" basis, reflecting not only changes in basic hourly and incentive wage rates, but also such variable factors as premium pay for overtime and late shift work, and changes in output of workers paid for an incentive plan.

Average Weekly Earnings: derived by multiplying average weekly hours by hourly earnings.

ERDA:

Energy, Research and Development Administration. ERDA was formed in 1974 to bring together activities previously scattered among several agencies. The major elements covered were nuclear energy, fossil energy, solar and geothermal energy, conservation through increased efficiency and environmental controls. Most of these functions were assumed by the Department of Energy as of October 1, 1977.

Establishment:

the basis for reporting to the Census of Manufacturers; an operating facility in a single location.

Evaluation (Department of Defense):

determination of technical suitability of material, equipment or a system; see *RDT&E*.

Expenditures (Federal Budget):

see *Outlays*.

Exports:

domestic merchandise including commodities which are grown, produced, or manufactured in the United States, and commodities of foreign origin which have been changed in the United States from the form in which they were imported, or which have been en-

hanced in value by further manufacture in the United States, and which are traded or sold to other nations.

Export-Import Bank of the United States (Eximbank):

created in 1934, and established as an independent U.S. Government Agency in 1945, Eximbank is designed "... to aid in financing and to facilitate exports ...". Eximbank receives no appropriations from the U.S. Congress. It is directed by statute to (1) offer financing that is competitive with that offered exporters of other countries by their official export credit institutions, (2) determine that the transactions supported provide for a reasonable assurance of repayment, (3) supplement, but not compete with private sources of export financing, and (4) take into account the effect of its activities on small business, the domestic economy, and U.S. employment.

FAA:

Federal Aviation Administration (formerly the Federal Aviation Agency), an agency of the Department of Transportation.

Facility:

a physical plant or installation including real property, building, structures, improvements and plant equipment.

Fiscal Year (Federal Budget):

until June 30, 1976, year beginning July 1 and ending June 30, and designated by the year in which it ends. Beginning October 1, 1976, the fiscal years run from October 1 through September 30 and are designated by the year in which they end. A three month *Transition Quarter* from July 1 through September 30, 1976, belongs to neither fiscal year.

Flyaway Value:

includes the cost of the airframe, engines, electronics, communications, armament and other installed equipment.

Foreign Military Sales (FMS):

export sales to foreign governments arranged through the Department of Defense, whereby DOD recovers full purchase price and administrative costs; often mistakenly used to include foreign military aid and foreign commercial sales as well.

FY:

see *Fiscal Year*.

General Agreement on Tariffs and Trade (GATT):

a multilateral treaty, subscribed to by 98 governments which together account for more than four-fifths of world trade; its aim is to liberalize world trade; the only multilateral instrument that lays down agreed rules for international trade.

General Aviation:

all civil flying except that of air carriers.

GNP (Gross National Product):

the market value of the total output of goods and services produced by the nation's economy before deduction of depreciation charges and other allowances for business and institutional consumption of durable goods. It includes the purchase of goods and services by consumers and government, gross private domestic investment and net exports.

Helicopter:

a rotary-wing aircraft which depends principally for its support and motion in the air upon the lift generated by one or more power-driven rotors, rotating on substantially vertical axes. A helicopter is a *VISTOL*.

Heliport:

an area, either at ground level or elevated on a structure, that is used for the landing and take-off of *helicopters* and includes some or all of the various facilities useful to helicopter operations such as helicopter parking, hangar, waiting room, fueling and maintenance equipment.

Helistop:

a minimum facility *heliport*, either at ground level or elevated on a structure for the landing and takeoff of *helicopters* but without such auxiliary facilities as waiting room, hangar parking, etc.

ICBM:

Intercontinental Ballistic Missile, with a range of more than 5,000 miles.

Imports:

classified as "general imports" or "imports for consumption." This volume refers generally to "imports for consumption," which are entries for immediate consumption plus merchandise withdrawn from bonded storage warehouses for consumption. Data are compiled from Import Entries filed with U.S. Customs officials, and are in general based on the market value or price in the foreign country at the time of exportation of such merchandise, including the cost of containers and coverings, as well as other charges and expenses incidental to placing the merchandise in condition, packed and ready for shipment to the United States, but excluding import duties, insurance, freight and other charges incidental to arrival of the goods in the United States. The foreign values of imported merchandise are converted into U.S. currency at the rate of exchange prevailing on the day the merchandise is shipped to the United States.

Income:**Net Operating Income:**

total net sales (see *Sales*) less total operating costs.

Net Income (Before Income Taxes):

Net Operating Income plus or minus "*Other Income and Expenses*."

Other Income and Expenses:

includes interest income, royalty income, capital gains and losses, interest expense, cash discounts, etc.

Net Income (After Income Taxes):

Net Income (Before Taxes) less federal income taxes.

Lump-Sum Wage Payment:

a one time payment given in lieu of general wage increases and/or cost of living adjustments in labor settlements.

Manufacturing Industries:

those *establishments* engaged in the mechanical or chemical transformation of inorganic or organic substances into new products, and usually described as plants, factories, or mills, which characteristically use power-driven machines and materials-handling

equipment; also establishments engaged in assembling component parts of manufactured products if the new product is neither a structure nor other fixed improvement.

Merchandise Trade Balance:

the difference between the value of U.S. goods exported to other countries and foreign goods imported into this country. The trade balance is generally regarded as "favorable" when *exports* exceed *imports*—a trade surplus—and "unfavorable" when *imports* exceed *exports*—a trade deficit.

Missile:

sometimes applied to space launch vehicles, but more properly connotes automated weapons of warfare, *i.e.*, a weapon which has an integral system of guidance, as opposed to the unguided rocket.

Multilateral Trade Negotiations (MTN):

a forum within the *GATT* in which countries negotiate to overcome their trade problems. In September 1986, in Punta del Este, Uruguay, over 100 nations launched a new round of multilateral trade negotiations, called the "Uruguay Round." The purpose of the "Uruguay Round" is to strengthen the *GATT* and expand its disciplines to new areas such as services, agriculture and trade-related intellectual property rights.

NASA:

National Aeronautics and Space Administration.

NATO:

North Atlantic Treaty Organization.

New Obligational Authority (Federal Budget):

see *Budget Authority*.

Non-Aerospace Products and Services:

products and services other than aircraft, missiles, space vehicles, and related propulsion and parts, produced or performed by establishments whose principal business is the development and/or manufacture of aerospace products.

OASD:

Office of the Assistant Secretary of Defense.

Obligations (Federal Budget):

commitments made by Federal agencies to pay out money for products, services or other purposes—as distinct from the actual payments. Obligations incurred may not be larger than *budget authority*.

Orders, Net New:

the sales value of new orders (supported by legal documents) minus cancellations during the period.

Other Aerospace Products and Services:

all conversions, modifications, site activation, and other aerospace products (including drones) and services, plus research and development under contract, defined as basic and applied research in the sciences and in engineering, and design and development of prototype products and processes.

Other Customers:

All customers other than the U.S. Government to include but not limited to: air carriers, private citizens and corporations, state, local, and foreign governments.

Outlays:

checks issued, interest accrued on the public debt, or other payments made, net of refunds and reimbursements.

Overtime Hours:

that portion of the gross average weekly hours which was in excess of regular hours and for which premium payments were made.

Passenger-Mile:

one passenger moved one mile.

Payroll, All Manufacturing:

includes the gross earning paid in the calendar year to all employees on the payroll of operating manufacturing establishments. Includes all forms of compensation paid directly to workers such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions,

withholding taxes, group insurance, union dues, and savings bonds. Does not include employers' Social Security contributions or other non-payroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

Procurement:

the process whereby the executive agencies of the Federal Government acquire goods and services from enterprises other than the Federal Government.

Production Workers:

includes working foremen and all non-supervisory workers (including leadmen and trainees) engaged in fabricating, processing, assembling, inspection, receiving, storage, handling, janitorial services, product development, auxiliary production for plant's own use and record keeping and services closely associated with the above production operations.

R&D:

Research and Development.

Research: systematic study directed toward fuller scientific knowledge or understanding of the subject studied. Research is classified as either *basic* or *applied* according to the objectives of the sponsoring agency.

Basic Research: with the objective of gaining fuller knowledge or understanding of the fundamental aspects of phenomena and of observable facts without specific applications toward processes or products in mind.

Applied Research: with the objective of gaining knowledge or understanding necessary for determining the means by which a recognized and specific need may be met.

Development: the systematic use of scientific knowledge directed toward the production of useful materials, devices, systems, or methods including design and development of prototype and processes.

Independent Research and Development (IR&D): a term devised by the Department of Defense and used by Federal agencies to differentiate between a contractor's research and de-

velopment technical effort performed under a contract, grant, or other arrangement (R&D) and that which is self-initiated and self-funded (IR&D).

Industrial Research and Development: research and development work performed within company facilities, funded by company or Federal funds, and excluding company-financed research and development contracted to outside organizations such as research institutions, universities and colleges, or other non-profit organizations.

RDT&E (Department of Defense):

Research, Development, Test and Evaluation.

Related Products and Services:

sales of electronics, software, and ground equipment in support of aerospace products, plus sales by aerospace manufacturing establishments of systems and equipment which are generally derived from the industry's aerospace technological expertise in design, materials, and processes, but which are intended for applications other than flight.

Research:

see *R&D*.

Rotorcraft:

an aircraft which in all its usual flight attitudes is supported in the air wholly or in part by a rotor or rotors, *i.e.*, airfoils rotating or revolving about an axis (see *Helicopter*).

Sales:

net of returns, allowances, and discounts, the dollar value of shipments, including dealer's commission, if any, which have passed through the sales account.

Satellite:

a body that revolves around a larger body, such as the moon revolving around the earth, or a man-made object revolving about any body such as the sun, earth, or moon.

SIC (Standard Industrial Classification):

a system developed by the U.S. Government to define the industrial composition of the economy, facilitating

comparability of statistics. See *Aerospace Industry* for explanation of SIC codes applicable to the aerospace industry.

Space Vehicle:

an artificial body operating in outer space (beyond the earth's atmosphere).

Stockholder's Equity:

assets minus all obligations of the corporation, except those to stockholders. Annual data are average equity for the year (using four end-of-quarter figures.) For details, see "Quarterly Financial Report for Manufacturing, Mining and Trade Corporations," compiled by the Bureau of the Census.

STOL:

short take-off and landing aircraft.

Test (Department of Defense):

an experiment designed to assess progress in attainment or accomplishment of development objectives (see *RDT&E*).

Thrust:

the driving force exerted by an engine, particularly an aircraft or missile engine, in propelling the vehicle to which it is attached.

Ton-Mile:

one ton moved one mile.

Total Obligational Authority:

the sum of *budget authority* granted or requested from the Congress in a given year, plus unused *budget authority* from prior years.

Trade Balance:

see *Merchandise Trade Balance*.

Transition Quarter (Tr. Qtr.):

the three-month interval from July 1, 1976 to September 30, 1976. See *Fiscal Year*.

Turbine, Turbo:

a mechanical device or engine that spins in reaction to a fluid flow that passes through or over it. Frequently used in "turboprop" or "turbojet."

U.K.:

United Kingdom.

U.S.:

United States of America.

USA:

United States Army, an agency of the U.S. Department of Defense.

USAF:

United States Air Force, an agency of the U.S. Department of Defense.

USN:

United States Navy, an agency of the U.S. Department of Defense.

USSR:

Union of Soviet Socialist Republics.

Utility Aircraft:

an aircraft designed for general purpose flying.

V/STOL:

vertical short take-off and/or landing aircraft.
